THE SYSTEM SODIUM CHROMATE - SODIUM SULFATE - WATER  
(Results of Takeuchi, 1915)

The mixtures were rotated at constant temperature until attainment of equilibrium and both the saturated solutions and the undissolved residues were analyzed.

The decahydrates of sodium and chromium are isomorphous and the results show that these two salts are mutually miscible in all proportions at 15°. At 25° the solubility curve consists of three branches. The solutions of the first branch are in equilibrium with decahydrated mixed crystals, those of the second branch with anhydrous sulfate and those of the third with hexahydrated sodium chromate.

Solid phases: a = Solid Solution of  $\text{Na}_2\text{CrO}_4 \cdot 6\text{H}_2\text{O}$  in  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$

b =  $\text{a} + \text{Na}_2\text{SO}_4$

c =  $\text{Na}_2\text{SO}_4 + \text{Na}_2\text{CrO}_4 \cdot 6\text{H}_2\text{O}$

d =  $\text{Na}_2\text{CrO}_4 \cdot 6\text{H}_2\text{O}$

Additional data are given by Osaka and Yoshida, 1922 for the isotherms at 28°, 31° and 33°. The results are, however, expressed in accordance with the formula  $100 \text{ m H}_2\text{O}, x \text{ Na}_2\text{CrO}_4(100 - x) \text{ Na}_2\text{SO}_4$ , and the tables show only numerical values corresponding to x and m.

### (Results of Ryss and Zhukov, 1954 at 55.7°)

100 gms. absolute methyl alcohol dissolve 0.345 gms.  $\text{Na}_2\text{CrO}_4$  at 25°.  
(de Bruyn, 1892)

SOLUBILITY OF SODIUM DICHROMATE IN ETHANOL AT 19.4°  
(Reinitzer, 1913)

An excess of  $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$  was shaken with absolute alcohol for 10 minutes and the mixture filtered. The filtrate contained 5.132 gms.  $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$  per 100 cc. and its  $d_{19.4}$  was 0.8374. The solution decomposed within a few minutes with production of a brown precipitate and evolution of an aldehyde odor. The results are, therefore, only approximately correct.

SOLUBILITY OF SODIUM CHROMATE IN MIXTURES OF BENZENE AND ACETIC ACID  
(Anders, 1933)

t°	% $\text{CH}_3\text{COOH}$ in solvent	Gms. $\text{Na}_2\text{CrO}_4$ per 100 gms. sat. sol.	t°	% $\text{CH}_3\text{COOH}$ in solvent	Gms. $\text{Na}_2\text{CrO}_4$ per 100 gms. $\text{CrO}$ sat. sol.

5.66	-	1.68	-	-	-
7.90	-	1.25	-	-	-
18.40	-	0.38	-	-	-

Results for the quaternary system NaF+NaCl+Na<sub>2</sub>SO<sub>4</sub>+H<sub>2</sub>O at 25° and at 35° are also given.

Phase studies of the system Sodium Fluoride-Sodium Phosphate - Water at 25° and at 40° are given by Mason and Ashcraft, 1939. The results show that the supposed octahedral Na<sub>3</sub>PO<sub>4</sub>·10H<sub>2</sub>O is really the double salt NaF·2Na<sub>3</sub>PO<sub>4</sub>·19H<sub>2</sub>O, in samples of tri sodium phosphate containing as little as 0.1 percent Sodium Fluoride.

100 gms. water dissolve 12 gms. of the double sodium salt NaF·Na<sub>3</sub>PO<sub>4</sub>·12H<sub>2</sub>O at 25°, and 57.5 gms. at 70°. Sp. Gr. of solution at 25° = 1.0329; at 70° = 1.1091. (Briegleb, 1856)

## SOLUBILITY OF NaBeF<sub>4</sub> IN WATER (Vorobieva and Novoselova, 1948)

The salt was found to exist in both rhombic and monoclinic forms, and some of the results of Novoselova (Vol. I, p. 1260) are shown to be metastable.

# Na SODIUM

## SOLUBILITY OF SODIUM FLUORIDE IN SEVERAL SOLVENTS--Cont.

Melting point data are given for the following:

NaF+HF	(Euler, 1957)
NaF+FeF <sub>3</sub>	(Puschin and Baskov, 1913)
NaF+ZnF <sub>3</sub>	" "
NaF+NaI	(Ruff and Plato, 1903)
NaF+NaOH	(Scarpa, 1915)
NaF+Na <sub>2</sub> SO <sub>4</sub>	(Wolters, 1910) (Gladushchenko and Bergman, 1955) (Bergman and Rubleva, 1957a)
NaF+Na <sub>2</sub> SiO <sub>3</sub>	(Booth and Starrs, 1931) (Bergman, Nesterova and Bychkova, 1955)
NaF+Na <sub>2</sub> Si <sub>4</sub> O <sub>9</sub>	(Booth, Starrs and Bahnsen, 1933)
NaF+YF <sub>3</sub>	(Dergunov, 1948)
F NaF+AlF <sub>3</sub>	(Dergunov, 1948) (Mashovets, Beletskii, Saksonov and Svoboda, 1957)
NaF+LaF <sub>3</sub>	(Dergunov, 1948) (Zachariassen, 1948)
NaF+NaVO <sub>3</sub>	(Schmitz-Dumont and Schmitz, 1944)
NaF+ThF <sub>4</sub>	(Zachariassen, 1948)
NaF+UF <sub>4</sub>	(Barton, Friedmsn, et al, 1958) (Zachariassen, 1948)
NaF+UF <sub>4</sub> +ZrF <sub>4</sub>	(Ward, Strehlow, Grimes and Watson, 1958)
NaF+NaBF <sub>4</sub>	(Sullivanov and Stender, 1958)
NaF+CaF <sub>2</sub> +BaCl <sub>2</sub>	(Shul'ga and Bukhalova, 1957)
NaF+NaNO <sub>3</sub>	(Nyankovskaya and Bergman, 1952)
NaF+Na <sub>4</sub> P <sub>2</sub> O <sub>7</sub>	(Sholokhovich and Belyaev, 1957)
NaF+PbF <sub>2</sub>	(Schmitz-Dumont, Bergenhoff and Hartet)
NaF+SrF <sub>2</sub>	(Ershova and Ol'shanskii, 1958)
NaF+MgF <sub>2</sub>	" "
NaF+BaF <sub>2</sub>	(Ershova and Ol'shanskii, 1958) (Bergman and Banashek, 1953)
NaF+CaF <sub>2</sub>	(Ershova and Ol'shanskii, 1958)
NaF+PrF <sub>3</sub>	(Dergunov, 1952)
NaF+MoO <sub>3</sub>	(Schmitz-Dumont and Heckmann, 1952)
NaF+WO <sub>3</sub>	(Schmitz-Dumont, Bruns and Heckmann, 1953)
NaF+Na <sub>2</sub> MoO <sub>4</sub>	(Mateiko and Bukalova, 1955)
NaF-ZrF <sub>4</sub>	(Barton, Grimes, et al., 1958)
NaF-ZrF <sub>4</sub> -UF <sub>4</sub>	" " " "
2NaF+PbSO <sub>4</sub> = Na <sub>2</sub> SO <sub>4</sub> +PbF <sub>2</sub>	(Gladushchenko and Bergman, 1955)
NaF+Li <sub>2</sub> TiO <sub>3</sub>	(Belyaev and Sigida, 1957)
NaF+Li <sub>2</sub> TiO <sub>3</sub> = Na <sub>2</sub> TiO <sub>3</sub> +2LiF	" " " "
NaF+Na <sub>2</sub> TiO <sub>3</sub>	" " " "
2NaF+PbTiO <sub>3</sub> = Na <sub>2</sub> TiO <sub>3</sub> +PbF <sub>2</sub>	(Belyaev, 1954)
NaF-Na <sub>2</sub> U <sub>2</sub> O <sub>7</sub>	(Neuhaus, 1958)
Na <sub>3</sub> AlF <sub>6</sub> +Li <sub>3</sub> AlF <sub>6</sub>	(Beletskii and Saksonov, 1957)
Na <sub>3</sub> AlF <sub>6</sub> +Li <sub>3</sub> AlF <sub>6</sub> +Al <sub>2</sub> O <sub>3</sub>	(Mashovets and Petrov, 1957)
Na <sub>3</sub> AlF <sub>6</sub> +Na <sub>2</sub> O+Al <sub>2</sub> O <sub>3</sub>	(Bonnier, 1954)
Na <sub>2</sub> BeF <sub>4</sub> +RbBeF <sub>4</sub>	(Toropov and Grebenshchikov, 1956)
Na <sub>2</sub> BeF <sub>4</sub> +Li <sub>2</sub> BeF <sub>4</sub>	(Toropov and Shchetnikova, 1957, 1957a)

Reactions of the salts below their melting points were studied with X-rays by Link and Wood, 1940 for the following pairs:

NaF+KCl	NaF+KBr	NaF+KI
NaF+RbCl	NaF+RbBr	NaF+RbI
NaF+CsCl	NaF+CsBr	NaF+CsI

# Na SODIUM

## H SODIUM HYDRIDE NaH

The solubility of NaH in molten sodium is 1.5 wt. % at 400° and greater than 4% at 450°. (Williams, Grand and Miller, 1957)

## I SODIUM IODIDE NaI

### SOLUBILITY IN WATER

The data of Scott and Durham, 1930; Ricci and Yanick, 1936; Hill, Wilson and Bishop, 1933; Ricci, 1934, 1936 lie on a very smooth curve and are listed below to four significant figures. The values of de Coppet, 1883 agree and are given at other temperatures; above 140° the data are those of Keevil, 1942. Additional data are reported by Etard, 1884; Kremens, 1856a; Cocheret, 1911; Greenish, 1900; Meyerhoffer, 1904; Panfiloff, 1893, 1893a. Results on the ice curve and in equilibrium with NaI·5H<sub>2</sub>O are by Briggs and Geigle, 1940 (1); Jones et al., 1907 (2); Rudorff, 1862 (3); de Coppet, 1883 (4); Etard, 1894 (5); Panfiloff, 1893a (6).

\*In equilibrium with NaI·2H<sub>2</sub>O+NaI. At concentrations of NaOH less than 8.20 M, the solid phase is NaI·2H<sub>2</sub>O, and above 8.20 M it is NaI.

## Na SODIUM

## SOLUBILITY OF SODIUM IODIDE IN SODIUM HYDROXIDE SOLUTIONS AT 20°--Cont.

Data for the system  $\text{NaI-NH}_3\text{-H}_2\text{O}$  from  $-81^\circ$  to  $+216^\circ$  were determined by a polythermal method by Distanov, 1953.

THE SYSTEM SODIUM IODIDE - SODIUM IODATE - WATER  
(Ricci, 1934)

Additional results for this system at 8°, 25° and 40° are given by Hill, Willson and Bishop, 1933, but these authors failed to determine the true nature of the solid phases. They reported the presence of solid solutions (mixed crystals) instead of the double salt here shown to exist.

## SODIUM MERCURIC IODIDE

A saturated solution at 24.75°, prepared by adding NaI and HgI<sub>2</sub> in excess to water, contained 4.59% Na, 25% Hg, 58.25% I and 12.2% H<sub>2</sub>O, corresponding to 0.20 mol. alkali, 0.12 mol. Hg and 0.45 mol. I. (Duboin, 1905)

### THE SYSTEM SODIUM IODIDE - LEAD IODIDE - WATER (Roger, 1944)

Refractive indices were determined for many of the solutions at 25°. A complete phase diagram is drawn for the system at both 0° and 25°.

THE SYSTEM SODIUM IODIDE - IODINE - WATER

The system has been studied from the eutectic temperature to 113.5° (the NaI-I eutectic) by Briggs, Geigle, and Eaton, 1941, at 0° by Cheesman, Duncan, and Harris, 1940 and at 25° by Strelnikov, 1933 with good agreement among the various results. At 25° the only solid phases are NaI·2H<sub>2</sub>O and Iodine and the invariant solution contains 25.3 Wt. % NaI and 63.8% I<sub>2</sub>. Three polyiodides are found in the polythermal system and the formulas found by C. D. and H. are simpler than those of B. G. and E., although the % composition of each compound was found to be about the same in both investigations. No Triiodide is formed, in contrast to many other univalent metals.

SOLUBILITY OF SODIUM IODIDE IN ABSOLUTE ETHYL ALCOHOL AT TEMPERATURES UP  
TO THE CRITICAL POINT  
(Tyrer, 1910a)

The mixtures were placed in sealed glass tubes which were heated in a specially constructed, electrically heated air bath. The temperature at which the last trace of salt just dissolved was determined in each case. The experiments were made with very great care. Results are also given for the solubility of sodium iodide in the vapor of ethyl alcohol above the critical point.

<sup>a</sup>Lanning, 1932<sup>b</sup>Evertz and Livingston, 1949

m = metastable

100 gms. pure acetone sat. with CO<sub>2</sub> and NaI contain 23.4 gms. NaI at 16°. A saturated solution of NaI in acetone, through which a stream of CO<sub>2</sub> is passed, yields crystals of NaI·3(CH<sub>3</sub>COOCH<sub>3</sub>).

(Bell, Rowlands, Bamford, Thomas and Jones, 1931)

## Na SODIUM

## SOLUBILITY OF SODIUM IODIDE IN SEVERAL SOLVENTS

Solvent	t°	Solubility
Acetonitrile	0	22.09 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906.)
	25	18.43 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906.)
	18	26.5 gms NaI per 100 gms solvent (d. = 0.961) (Pavlopoulos and Strehlow, 1954)
	25	24.9 gms NaI per 100 gms solvent (d. = 0.948) (Pavlopoulos and Strehlow, 1954)
Propionitrile	0	9.09 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906)
	25	6.23 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906)
Nitromethane	0	0.34 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906)
	25	0.48 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906)
Furfural	25	25.10 gms NaI per 100 cc sat. sol. (Rohland, 1898; Walden, 1906)
Ethylene diamine	25	34.6 gms NaI per 100 gms solvent (Isbin and Kobe, 1945)
Monoethanol amine	25	22.0 gms NaI per 100 gms solvent (Isbin and Kobe, 1945)
Ethylene glycol	25	107.4 gms NaI per 100 gms solvent (Isbin and Kobe, 1945)
Formic acid	18	62.7 gms NaI per 100 gms solvent (d. = 1.668) (Pavlopoulos and Strehlow, 1954)
	25	61.8 gms NaI per 100 gms solvent (d. = 1.657) (Pavlopoulos and Strehlow, 1954)

Data for the distribution of NaI between ethylene glycol and ethyl acetate at 30° are given by Dawson and Griffith, 1951

The effect of small quantities of NaI on the miscibility temperature of methanol and cyclohexane is reported by Eckfeldt and Lucasse, 1943

## SOLUBILITY OF SODIUM IODIDE IN LIQUID AMMONIA

t°	Gms. NaI per 100:		Authority
	gms. sat. sol.	cc sat. sol.	
-42.2	-	44.8	(Sherer, 1931.)
-37.8	-	48.8	" "
-35.2	-	51.3	" "

## SOLUBILITY IN LIQUID SULFUR DIOXIDE

0°	-	15.0 gms NaI per 100 gms SO <sub>2</sub>	(Jander and Ruppolt, 1937)
25°	-	1.59 gms NaI per 100 gms sat. sol	(Shatenstein and Viktorov, 1937).
25°	-	2.1 gms NaI per 100 gms SO <sub>2</sub>	(Watt, Jenkins and Robertson, 1950)

Results for the vapor pressure-temperature relations in the system NaI + SO<sub>2</sub> are given by Foote and Fleischer, 1931.

100 cc. anhydrous hydrazine dissolve 64 gms. NaI at room temp.  
(Welsh and Broderson, 1951.)

Melting points were determined for:

NaI + NaOH	Scarpa, 1915
NaI + CdI <sub>2</sub> + PbI <sub>2</sub>	Il'yasov and Bostandzhiyan, 1957

Reactions of the salts below the melting points were studied with X-rays by Link and Wood, 1940 for the following pairs:

SODIUM IODATE NaIO<sub>3</sub>

10

## SODIUM POLYMOLYBOATES

## SOLUBILITIES IN WATER

Salt	t°	Gms. anhydrous salt per 100 gms. sat. sol.	Reference
$\text{Na}_2\text{Mo}_3\text{O}_{10} \cdot 7\text{H}_2\text{O}$	20	3.878	(Ullik, 1867)
	24	8.60	(Bye, 1943, 1945)
	30	13.68	(Rosenheim, 1916)
	100	13.7	(Ullik, 1867)
$\text{Na}_2\text{Mo}_4\text{O}_{13} \cdot 7\text{H}_2\text{O}$	24	9.41	(Bye, 1943, 1945)
$5\text{Na}_2\text{O} \cdot 12\text{MoO}_3 \cdot 38\text{H}_2\text{O}$	30	54.06	(Rosenheim, 1916)

Melting points are given for:

$\text{Na}_2\text{MoO}_4 + \text{PbMoO}_4$	(Belyaev, 1952)
$\text{Na}_2\text{MoO}_4 + \text{Na}_2\text{SO}_4$	(Belyaev, 1952)(Boeke, 1907)
	(Belyaev and Doroshenko, 1954)
$\text{Na}_2\text{MoO}_4 + \text{PbSO}_4 \rightleftharpoons \text{Na}_2\text{SO}_4 + \text{PbMoO}_4$	(Belyaev, 1952, 1952a)
$\text{Na}_2\text{MoO}_4 + \text{Na}_2\text{WO}_4$	(Boeke, 1907)
$\text{Na}_2\text{MoO}_4 + \text{MoO}_3$	(Hoermann, 1929)
$\text{Na}_2\text{MoO}_4 + \text{Na}_4\text{P}_2\text{O}_7$	(Belyaev and Sholokhov, 1953)
$\text{Na}_2\text{MoO}_4 + \text{PbTiO}_3 \rightleftharpoons \text{Na}_2\text{TiO}_3 + \text{PbMoO}_4$	(Belyaev, 1954)

SODIUM AZIDE  $\text{NaN}_3$ 

N

SOLUBILITY OF SODIUM AZIDE IN WATER  
(Wohlgemuth, 1934)

t°	Gms. $\text{NaN}_3$ per 100 gms. sat. sol.	Solid Phase	t°	Gms. $\text{NaN}_3$ per 100 gms. sat. sol.	Solid Phase
-6	10.0	Ice	0	28.0	$\text{NaN}_3$
-15.1 Eutec.	21.6	" + $\text{NaN}_3 \cdot 3\text{H}_2\text{O}$	+16	28.7(1)	"
-20 "	26.8*	" + $\text{NaN}_3$	20	29.0	"
-8	24.0	$\text{NaN}_3 \cdot 3\text{H}_2\text{O}$	100	35.6	"
-2.1 tr.pt.		" + $\text{NaN}_3$			

\*Metastable; (1) Curtius and Rissom, 1898.

100 gms. methanol dissolve 3.16g  $\text{NaN}_3$  at 25° (d. = 0.8083). The solubility in acetone, chloroform, cyclohexane, carbon tetrachloride, trichloroethylene and ethyl acetate is less than 0.005 gm/100 ml of solution

(Hudswell, Nairn and Gadsby, 1951)

100 gms alcohol of  $d_{17} = 0.799$  dissolve 0.22 gms.  $\text{NaN}_3$  at 0° and 0.46 gms. at the b. pt.; 100 gms. benzene dissolve 0.10 gms.  $\text{NaN}_3$  at the b. pt.

(Cranston and Livingstone, 1926.)

# Na SODIUM

## NN SODAMMONIUM $\text{Na}_2(\text{NH}_3)_2$

100 gms. liquid ammonia dissolve 60.5 gms.  $\text{Na}_2(\text{NH}_3)_2$  at  $-23^\circ$ ,  
56.4 gms. at  $0^\circ$ , 56 gms. at  $+5^\circ$  and 55 gms. at  $9^\circ$ . (Joannis, 1906.)

## SODIUM AMIDE $\text{NaNH}_2$

100 gms. Liquid Ammonia dissolve 0.004 gm.  $\text{NaNH}_2$  at  $0^\circ$ . (Hunt and Boncyk, 1933.)

## NO SODIUM NITRITE $\text{NaNO}_2$

### SOLUBILITY OF SODIUM NITRITE IN WATER

(Bureau, 1934, 1937)

The author shows that the previous results of Helberg, 1925, and Oswald, 1912, 1914, in the vicinity of the eutectic point, are erroneous. These authors also failed to detect the hemihydrate.

THE SYSTEM SODIUM NITRITE - SODIUM NITRATE - WATER  
(Oswald, 1912, 1914)

Bureau, 1937 also gives results for the system NaNO<sub>2</sub> + NaNO<sub>3</sub> at 0°, 18.5°, 56.1°, and 98.5°. His results agree closely with the following results of Oswald at 0°. His results at 18.5° are practically identical with those of Rakowski and Slavina, 1931, at 15°. His results at 56.1° are all under those of Oswald at 51° but at 98.5° they exceed Oswald's values at 103°, in the region where both salts are in excess.

In addition to those following, Oswald gives results at 16°, 18°, 65°, 81° and 92°.

Results at 0°		Results at 21°		Results at 52°		Results at 103°

	55	15.2	58.3	21.5	$\text{AgNO}_2 + \text{Na}_2\text{Ag}_2(\text{NO}_2)_4 \cdot \text{H}_2\text{O}$
NO	74.7	11.3	78.3	13.4	$\text{NaNO}_2 + \text{Na}_2\text{Ag}_2(\text{NO}_2)_4 \cdot \text{H}_2\text{O}$

### THE SYSTEM SODIUM NITRITE - THALLIUM NITRITE - WATER AT $25^\circ$ (Cavalca, Nardelli and Braibanti, 1955)

Sat. Sol. Wt. %		Solid Phase
$\text{TlNO}_2$	$\text{NaNO}_2$	
22.72	16.69	$\text{TlNO}_2$
24.80	32.06	"
25.64	35.46	$\text{TlNO}_2 + \text{NaNO}_2$
12.26	41.20	$\text{NaNO}_2$

The System  $\text{NaNO}_2 - \text{Pb}(\text{NO}_3)_2 - \text{H}_2\text{O}$  was studied by Vartak and Kabadi, 1955 by evaporation of various solutions at room temperature. A 1:1:1 compound was found, and possibly solid solutions. Conductivities in the system are given by Vartak and Kabadi, 1954.

### SOLUBILITY OF SODIUM NITRITE IN VARIOUS SOLVENTS

Solvent	$t^\circ$	Solubility
94.5 vol. % ethanol (d. = 0.810)	25	1.424 gms $\text{NaNO}_2$ per 100 gms solvent (Schnellbach and Rosin, 1929.)
abs. methanol	19.5	4.43 gms $\text{NaNO}_2$ per 100 gms solvent (de Bruyn, 1892)
abs. ethanol	19.5	0.31 gms $\text{NaNO}_2$ per 100 gms solvent (de Bruyn, 1892).
ethylene glycol	25	16.78 gms $\text{NaNO}_2$ per 100 gms solvent (Palit, 1947)
propylene glycol	25	8.47 gms $\text{NaNO}_2$ per 100 gms solvent (Palit, 1947)
ethylene diamine	30	12.60 gms $\text{NaNO}_2$ per 100 gms solvent (Maniyappan and Anjaneyalu, 1957)
monoethanol amine	30	8.74 gms $\text{NaNO}_2$ per 100 gms solvent (Maniyappan and Anjaneyalu, 1957)

Melting points have been determined for:

$\text{NaNO}_2 + \text{NaNO}_3$  (Bruni and Meneghini, 1909, 1910; Bergman, Berul and Nikonova, 1953; Berul and Bergman, 1954)  
 $\text{NaNO}_2 + \text{NaOH}$  (Bergman and Reshetnikov, 1954; Reshetnikov and Vilutis, 1958)  
 $\text{NaNO}_2 + \text{KOH}$  (Bergman and Reshetnikov, 1954)  
 $\text{NaNO}_2 + \text{Ca}(\text{NO}_2)_2$  (Protzenko and Belova, 1957)  
 $2\text{NaNO}_2 + \text{Ca}(\text{NO}_3)_2 \rightleftharpoons 2\text{NaNO}_3 + \text{Ca}(\text{NO}_2)_2$  " " " "

# SODIUM RHODONITRITE $\text{Na}_6\text{Rh}_2(\text{NO}_2)_{12}$

100 gms.  $\text{H}_2\text{O}$  dissolve 40 gms. at  $17^\circ$ , and 100 gms. at  $100^\circ$ .  
(Leidie, 1890.)

## SODIUM NITRATE $\text{NaNO}_3$

NO

THE SYSTEM SODIUM NITRATE - SODIUM SULFATE - WATER  
(Chretien, 1929)

Less complete results differing in certain details from these are given by Massink, 1918, Foote, 1925 and Hamid, 1926. Other results in general agreement are given by Benrath, 1928, in connection with a study of the equilibrium in the reciprocal salt pair  $\text{Na}_2(\text{NO}_3)_2 + \text{MgSO}_4 + \text{H}_2\text{O}$ , at 15°, 25°, 50° and 97°.

A number of other determinations are given by Schroder, 1929a, b, 1930, in connection with his studies of this same reciprocal salt pair.

For data at 240°, see table following.

NO

$\text{S.10} = \text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$      $\text{S} = \text{Na}_2\text{SO}_4$      $\text{N} = \text{NaNO}_3$      $1.1.2 = \text{NaNO}_3 \cdot \text{Na}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$

## THE SYSTEM SODIUM NITRATE - ISO PROPYL ALCOHOL - WATER AT 25° (Ginnings and Chen, 1931)

Points on the binodal curve of this system were determined by titrating mixtures of the salt and one of the liquids with the other liquid until clouding appeared or disappeared. Tie lines, \*, were located by means of determinations of the salt in two layers in contact with each other. The plait point, PP, was found by plotting.

The effect of the addition of 0.06 - 0.12 molar sodium nitrate on the mutual solubility of n-butyl alcohol and water is reported by Reber, McNabb, and Lucasse, 1942.

The composition of the plait point for the system Sodium Nitrate - Tertiary Butyl Alcohol - Water at 25° was found by Ginnings, Herring and Webb, 1933, to be 32.4 wt. percent NaNO<sub>3</sub> + 11.6 wt. percent (CH<sub>3</sub>)<sub>3</sub>COH

Ginnings and Dees, 1935, and Ginnings, Webb and Hinohara, 1933, have respectively determined the binodal curves for the systems Sodium Nitrate - Allyl Alcohol - Water at 25° and Sodium Nitrate - Pyridine - Water at 25°, but the original results are not given but only the values of constants for the curves calculated by means of empirical equations.

64.8	23.0	
76.0	10.8	
87.6	3.2	

NO

At 43.5°, two liquid layers are reported in the above system. See Int. Critical Tables III, p. 410.

Data for the distribution of NaNO<sub>3</sub> between methyl isobutyl ketone and HNO<sub>3</sub> - Ca(NO<sub>3</sub>)<sub>2</sub> solutions at 20° are given by Rydberg and Bernstrom, 1957

Polythermal data for the system NaNO<sub>3</sub> - Urea - Water from -19.55° (eutectic) to +40° are reported by Polosin and Tarasova, 1956.

SOLUBILITY OF NaNO<sub>3</sub> IN VARIOUS SOLVENTS

Solvent	t°	Solubility
CH <sub>3</sub> OH	25	0.41 gms NaNO <sub>3</sub> per 100 gms solvent (deBruyn, 1892)
C <sub>2</sub> H <sub>5</sub> OH	25	0.036 gms NaNO <sub>3</sub> per 100 gms solvent (deBruyn, 1892)
Pyridine	25	0.34 gms NaNO <sub>3</sub> per 100 cc solvent (Muller, 1925)
Dioxane	25	0.003 gms NaNO <sub>3</sub> per 100 gms sat. sol. (Ricci and Selikson, 1942)
Ethylenediamine	25	33.5 gms NaNO <sub>3</sub> per 100 gms solvent (Isbin and Kobe, 1945)
Hydroxylamine	17/18	13.1 gms per 100 gms solvent (deBruyn, 1892)
Hydrazine	room	100 gms per 100 cc solvent (Welsh and Broderson, 1915)
Anhydrous HNO <sub>3</sub>	?	1.5 gms per 100 gms solvent (Jander and Wendt, 1948)

Data for the effect of small quantities of NaNO<sub>3</sub> on the miscibility temperature of CH<sub>3</sub>OH + cyclohexane are reported by Eckfeldt and Lucasse, 1943

The System  $\text{Na}_2\text{O} - \text{Ga}_2\text{O}_3 - \text{H}_2\text{O}$  was studied by Gevorkyan and Gurovich 1957 at 18° and 60°. The solid phases were  $\text{Ga}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$  and  $4\text{Na}_2\text{O} \cdot \text{Ga}_2\text{O}_3 \cdot 15\text{H}_2\text{O}$  at 18° and  $\text{Ga}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ ,  $2\text{Na}_2\text{O} \cdot \text{Ga}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$  (in 20 - 30% NaOH), and  $3\text{Na}_2\text{O} \cdot \text{Ga}_2\text{O}_3 \cdot 13\text{H}_2\text{O}$  (in 30 - 40% NaOH). The maximum solubility of  $\text{Ga}_2\text{O}_3$  in NaOH is 28%

Results for the system NaOH - "Industrial Methylated Spirit" (commercial ethyl alcohol in Great Britain) - H<sub>2</sub>O at 25°, 60° are given by Mills and Hughes, 1957, and are similar to those above. NaOH is more soluble in high alcoholic solutions, and less soluble in dilute (below 48 wt. %) solutions

## THE SYSTEM SODIUM HYDROXIDE - ACETONE - WATER AT 0° (Gibby, 1934)

For additional data see Duhamel and Laurent, 1952, 1953.

Points on the binodal curve were determined by titration of acetone into aqueous sodium hydroxide solutions until a permanent separation into two layers was observed. A few mixtures of known composition were prepared in which the amount of NaOH in each layer was determined.

OH

Data for equilibrium in the system sodium hydroxide - resorcinol - water at 30° are given by van Meura (1916).

SOLUBILITY OF SODIUM HYDROXIDE IN METHYL ALCOHOL AND IN  
ETHYL ALCOHOL AT ABOUT 28°  
(Murray, 1929)

The mixtures were shaken occasionally at room temperature during about three weeks. Portions of the clear supernatant solutions were then removed, weighed and titrated with normal sulfuric acid.

Solvent	d. of sat. sol.	Normality of sat. sol.	Gms. NaOH per:	
			100 cc sat. sol.	100 gms. sat. sol.
Methyl Alcohol	1.01	5.98	23.9	23.6
Ethyl Alcohol	0.93	3.40	13.6	14.7

1000 gms. liquid ammonia dissolve 0.0025 gm. NaOH at -40°.

(Skossareswky and Tchitchinadze, 1918)

Melting points have been determined for:

NaOH + Na <sub>2</sub> SO <sub>4</sub>	(Khitrov and Khitrova, 1953)(Ravich and Elenevskaya, 1954)
NaOH + Na <sub>2</sub> CrO <sub>4</sub>	(Khitrov and Khitrova, 1953)
NaOH + Na <sub>2</sub> MoO <sub>4</sub>	(Khitrov and Khitrova, 1953)
NaOH + NaBr	(Okada, Yoshizawa and Watanabe, 1953)(Seward, 1955)
NaOH + NaI	(Okada, Yoshizawa and Watanabe, 1953)
NaOH + NaBr + NaI	(Okada, Yoshizawa and Watanabe, 1953)
NaOH + HCOONa	(Sirotkin, 1950)(Schwab, Glatzer and Kovos, 1955)
NaOH + KBr	(Seward, 1955)
NaOH + K <sub>2</sub> CO <sub>3</sub>	(Seward, 1955)
NaOH + Na <sub>2</sub> CO <sub>3</sub>	(Seward, 1955)

## Na SODIUM

## PO SODIUM PHOSPHATES (ortho)

THE SYSTEM  $\text{Na}_2\text{O} - \text{P}_2\text{O}_5 - \text{H}_2\text{O}$   
(Wendrow and Kobe, 1952, 1954)

The system was investigated in detail from  $0^\circ$  to  $100^\circ$ , and the results compared with those of previous investigators. In general, there is reasonable agreement among the various data. Some of the data of D'Ans and Schreiner, 1910a at  $25^\circ$  are apparently incorrect, e.g. the solubility of trisodium phosphate is too high. The data of Menzel and von Sahr, 1937 at  $20^\circ$  for trisodium phosphate agree with those of W.&K.

TSP = trisodium phosphate

DSP = disodium phosphate

MSP = monosodium phosphate

HSP = hemisodium phosphate

SYSTEM SODIUM OXIDE - PHOSPHORUS PENTOXIDE - WATER FROM 25° TO 100° C.  
 (Wendrow and Kobe, 1953, 1954)

PO

SODIUM Na

# Na SODIUM

## PO TRISODIUM PHOSPHATE $\text{Na}_3\text{PO}_4$

### SOLUBILITY IN WATER

The solubility results have been reviewed by Kobe and Leipper, 1940 and Wendrow and Kobe, 1954, 1956. Below about 55° the solid phase  $\text{Na}_3\text{PO}_4 \cdot 1/4\text{NaOH} \cdot 12\text{H}_2\text{O}$  is in equilibrium with a solution having  $\text{Na}_2\text{O}/\text{P}_2\text{O}_5$  ratio of 3.00. The composition of this solid has been reported as containing 1/7, 1/5 or 1/11 - 2/9 (variable) moles NaOH. Differences between the several results are probably due to the particular solid phase chosen as the "triphosphate". The data below are for solutions containing  $\text{Na}_2\text{O}/\text{P}_2\text{O}_5 = 3.00$ .

150°	80.0	218°	40	350°	0.15
160°	76.0	220°	37		

### Note on solid phases:

Ref (2) considers the complex salt as  $\text{Na}_3\text{PO}_4 \cdot 1/5\text{NaOH} \cdot 12\text{H}_2\text{O}$

Ref (3) gives no solid compositions

Ref (4) thought  $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$  stable 0 - 40°;  $\text{Na}_3\text{PO}_4 \cdot 10\text{H}_2\text{O}$  from 50° to 65°, and  $\text{Na}_3\text{PO}_4 \cdot 8\text{H}_2\text{O}$  at 70, 75°.

Ref (6) Reported  $\text{Na}_3\text{PO}_4 \cdot 10\text{H}_2\text{O}$  below 75°; transition to  $\text{Na}_3\text{PO}_4 \cdot 8\text{H}_2\text{O}$  (?) at 75°;  $\text{Na}_3\text{PO}_4 \cdot 8\text{H}_2\text{O}$  (?) at 80°-121°; transition to  $\text{Na}_3\text{PO}_4 \cdot \text{H}_2\text{O}$  at 121°;  $\text{Na}_3\text{PO}_4 \cdot \text{H}_2\text{O}$  from 121° to 215°; transition to  $\text{Na}_3\text{PO}_4$  at 215°;  $\text{Na}_3\text{PO}_4$  stable above 215°.

SOLUBILITY OF  $\text{Na}_3\text{PO}_4$  IN-AQUEOUS SOLUTIONS OF SODIUM HYDROXIDE  
(Schroeder, Berk and Gabriel, 1937)

For data at  $0^\circ$ - $100^\circ$  see Wendrow and Kobe, 1952, 1954 under the system  $\text{Na}_2\text{O} - \text{P}_2\text{O}_5 - \text{H}_2\text{O}$ .

# Na SODIUM

## PO TRISODIUM PYROPHOSPHATE $\text{Na}_3\text{HP}_2\text{O}_7$

### SOLUBILITY IN WATER (Hubbard, 1949)

The salt was prepared by adding NaOH to a suspension of  $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$  in water, and subsequent recrystallization. Solutions of the salt slowly hydrolyzed and the results are listed for solutions which stood between 24 and 48 hours, which corresponds to about 0.1% orthophosphate produced in the solution.

The solubility of the polymer  $(\text{Na}_5\text{P}_3\text{O}_{10})_x$  where  $x$  is 2 or more, is 32.5 gms. per 100 gms. saturated solution at 25°. This is more than twice as soluble as the monomer. (King, 1947).

## Na SODIUM

### SODIUM METHYL PHOSPHATE (neutral) $\text{Na}_2\text{CH}_3\text{PO}_4 \cdot 6\text{H}_2\text{O}$

100 gms. sat. solution of neutral sodium methyl phosphate in water contain 30.79 gms. of the anhydrous salt at  $12^\circ.5$ . (Bailly, 1919.)

### SODIUM $\beta$ GLYCERO PHOSPHATE $\text{Na}_2\text{C}_3\text{H}_5(\text{OH})_2\text{PO}_4 \cdot 5\text{H}_2\text{O}$

100 gms. sat. solution of sodium  $\beta$  glycerophosphate in water contain 27.16 gms. of the anhydrous compound at  $17^\circ$ . (Bailly, 1916.)

100 gms.  $\text{H}_2\text{O}$  dissolve 27.38 gms. sodium glycerophosphate at  $18^\circ$ .  
(H. Rogier, These, Paris, 1912.)

100 gms. 86.5% Glycerol ( $d = 1.2326$ ) dissolve 79.7 gms. of sodium glycerophosphate (?hydrated) at  $20^\circ$ .

100 gms. 98.5% Glycerol ( $d = 1.2645$ ) dissolve 82.4 gms. of sodium glycerophosphate (?hydrated) at  $20^\circ$ . (Holm, 1921, 1922.)

The partition and distribution of various phosphate species between solutions of  $\text{Na}_2\text{O} \cdot \text{P}_2\text{O}_5$  glasses in water and added acetone was studied by Van Wazer and Holst, 1950.

## ReO SODIUM PERRHENATE $\text{NaReO}_4$

The system Na<sub>2</sub>S - H<sub>2</sub>S - H<sub>2</sub>O was studied at 25°, 50°, and 100° by Sagaidachni, Vasiliev, and Roskina, 1939.

THE SYSTEM SODIUM SULFIDE - SODIUM SULFATE - WATER  
(Hogg, 1926)

The attainment of equilibrium was effected by (1) cooling homogeneous solutions from higher temperatures and, when necessary, inoculating with the appropriate solid phase (systems at 0°.1 and 18°), (2) heating heterogeneous systems from lower temperatures (systems at 25° and 31°) (3) evaporating homogeneous solutions under reduced pressure at the temperature of the experiment (40°) until sufficient solid appeared. When all phases were present the tubes were mechanically rotated in a thermostat for from 4 to 40 hours. The saturated solutions and moist solid phases were analyzed. MC with formula, indicates mixed crystals and the major constituent.

SOLUBILITY OF SODIUM SULFIDE IN LIQUID AMMONIA  
CONTAINING INCREASING AMOUNTS OF AMMONIUM BROMIDE AT  $-33^{\circ}$   
(Johnson and Wheatley, 1934)

Gm. Mols. per liter sat. sol.

$\text{NH}_4\text{Br}$	$\text{Na}_2\text{S}$
0.0	0.002
0.15	0.036
0.3	0.06
0.6	0.18

This increase in solubility of  $\text{Na}_2\text{S}$  is considered to be due to the formation of ammonium sulfide.

S

Melting point data are given for:

$\text{Na}_2\text{S} + \text{S}$	(Friedrich, 1914; Thomas and Rule, 1917; Pearson and Robinson, 1930)
$\text{Na}_2\text{S} + \text{Na}_2\text{SO}_4$	(Tammann and Olsen, 1930; Kohlmeier and Lohrke, 1955)
$\text{Na}_2\text{S} + \text{Na}_2\text{O}$	(Kohlmeier and Lohrke, 1955)

**ROMGALITE  $\text{NaHSO}_2 \cdot \text{CH}_2\text{O} \cdot 2\text{H}_2\text{O}$**

SOLUBILITY IN WATER  
(Kunin and Vlasjuk, 1951)

$t^{\circ}$	Gms. $\text{NaHSO}_2 \cdot \text{CH}_2\text{O} \cdot 2\text{H}_2\text{O}$ per 100 gms. sat. sol.	$t^{\circ}$	Gms. $\text{NaHSO}_2 \cdot \text{CH}_2\text{O} \cdot 2\text{H}_2\text{O}$ per 100 gms. sat. sol.
0	39	30	54
5	41	40	61
10	44	50	70
20	49		

The authors give results for the system  $\text{NaHSO}_2 \cdot \text{CH}_2\text{O} \cdot 2\text{H}_2\text{O} - \text{NaHSO}_2 \cdot \text{CH}_2\text{O} \cdot \text{H}_2\text{O} - \text{H}_2\text{O}$  at  $10^{\circ}$ ,  $20^{\circ}$  and  $40^{\circ}$ .

**SODIUM SULFITE  $\text{Na}_2\text{SO}_3$**

S0

THE SYSTEM  $\text{Na}_2\text{SO}_3 - \text{H}_2\text{O}$

The data for solutions in equilibrium with ice and with  $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$  are all in good agreement. Above the transition point  $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O} \rightleftharpoons \text{Na}_2\text{SO}_3$ , the results of Hartley and Barrett, 1909, are in error; those of Lewis and David, 1924, and of Kobe and Hellwig, 1955, agree; those of Foerster, Brosch and Norberg-Shulz, 1924, are somewhat higher.

THE SYSTEM  $\text{Na}_2\text{SO}_3 - \text{NaOH} - \text{H}_2\text{O}$   
(Hammick and Currie, 1925)

The mixtures were constantly stirred for 24 to 48 hours. Silver vessels were used for the stronger sodium hydroxide solutions. Both the saturated solutions and the solid phases were analyzed. The temperatures were constant to within  $0.1^\circ$ . The results are probably accurate to  $\pm 0.5$  per cent.

THE SYSTEM SODIUM SULFITE - SODIUM SULFATE - WATER  
(Rivett and Lewis, 1923)

Constant agitation was employed for assuring saturation. The solutions and solid phases were analyzed and the compositions of the latter identified by the "rest method." At  $25^\circ$  both a stable and a metastable system exists, and each was determined. The solid phases in contact

# Na SODIUM

## THE SYSTEM SODIUM SULFITE - SODIUM SULFATE - WATER--Cont.

with the solutions corresponding to the two branches of the stable system were respectively a series of mixed crystals of  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O} + \text{Na}_2\text{SO}_3 \cdot 10\text{H}_2\text{O}$  and  $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O} + \text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$ . The solid phases for the two branches of the metastable system were mixed crystals of anhydrous sulfite and sulfate.

The authors also determined the isotherms for 0.1°, 17.5° and 37.5°. At the latter temperature the solid phases were mixed crystals of the anhydrous salts. In subsequent papers by Lewis and David, 1924, data are given for many other isotherms.

A complete examination of the whole ternary system, at temperatures where only the anhydrous solids appeared, was made. The results showed that these two salts are capable of mixing in quite a number of distinct series of mixed crystals of varying stabilities. More than 80 solutions were prepared at 40°, 45° and 60° by more or less complicated methods, involving evaporation of unsaturated solutions of suitable concentrations to yield the solid phases in desired quantity at the temperature of the experiment. The analytical results, when plotted, show that there are no fewer than five solution curves and five corresponding series of mixed crystals. The precise limits of these are uncertain "but the error is not sufficient to affect the general conclusions."

## THE SYSTEM SODIUM SULFATE - WATER

The values were read from a plot of the very carefully determined values of Berkeley (1904) and Richards and Yugve (1918), whose original data are given in the tables following. Between 100° and 200° the results of White (1913-14) and of Schroeder, Gabriel and Cartridge (1935) agree and the average curve of these workers is given. Above 200° the results of these authors and of Booth and Bidwell (1950) and Beurath (1941), are given for comparison.

A large number of other determinations (below 100°) are in substantial agreement with those listed below. Early workers reported somewhat higher solubilities just above the transition point (32.38°), probably

# Na SODIUM

## THE SYSTEM SODIUM SULFATE - WATER--Cont.

due to supersaturation. For other data see Nishizawa (1920), Mulder, Lowel (1851), Tilden and Shenstone (1883), Etard (1894), Funk (1900a), Küpper (1927), Benrath, et al. (1928), Flöttmann (1928), Caven and Johnson (1928); Schröder (1929), Matsin, Oguri, Noda and Kumagi (1929), Makarow and Wachberg (1930), Rakowski and Nikitina (1931), Belopolski (1933), Keevil, 1942.

The values for wholly metastable  $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$  are by Eddy and Menzies (1940). Considerable additional data are given by Hartley, Jones and Hutchinson (1908) and other early workers.

30 Data for the effect of various salts upon the transition temperature of  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  are given by Norton and Johnston, 1926.

Freezing points in the system  $\text{H}_2\text{SO}_4 + \text{Na}_2\text{SO}_4$  are given by Kendall and Landon, 1920; Cambi and Bozza, 1923; Gillespie and Oubridge, 1956. Results for sodium pyrosulfate + sodium bisulfate are given by Cambi and Bozza, 1923; for the system  $\text{H}_2\text{SO}_4 + \text{Na}_2\text{SO}_4 + \text{ZnSO}_4$  by Kleinert and Wurm, 1952.

Results for the system  $\text{Na}_2\text{SO}_4 + 2\text{HCl} \rightleftharpoons 2\text{NaCl} + \text{H}_2\text{SO}_4 (+ \text{H}_2\text{O})$  at 25° (1 atm. HCl) are given by Korf and Shchatrovskaya, 1940.

Results for the system  $\text{Na}_2\text{SO}_4 - \text{H}_3\text{BO}_3 - \text{H}_2\text{O}$  at 0, 10, 20, 25° are given by Palkin and Goloshchapov, 1939.

# Na SODIUM

## THE SYSTEM SODIUM SULFATE - SODIUM HYDROXIDE - WATER

### Results from 0° - 30°

(Windmaisser and Stockl, 1950)

Earlier determinations by D'Ans and Schreiner, 1910, at 25° are not in agreement with the more recent work. Additional data at 30° are given by Pischinger and Szufarski, 1958. Results in electrochemical cells at 25° are reported by Okuno, Sakai and Matsuura, 1942.

## Na SODIUM

Results for the system  $\text{Na}_2\text{SO}_4 - \text{NaOH} - \text{H}_2\text{O}$  between  $150^\circ$  and  $350^\circ$  are given by Schroeder, Gabriel and Partridge, 1935, and Schroeder, Berk and Gabriel, 1937. For other data at high temperatures see Ravich and Borovaya, 1955.

### SOLUBILITY OF SODIUM SULFATE IN AQUEOUS AMMONIA SOLUTIONS (Guyer, Bieler and Orelli, 1940)

The data were read from curves drawn by the authors. The results are in gms.  $\text{Na}_2\text{SO}_4$  per 100 gms. solvent.

t°	% $\text{NH}_3$ in solvent				
	10	20	40	60	80
-30	-	1.4	0.8	0.8	0.7
-10	1.2	0.8	0.6	0.6	0.5
0	1.9	1.2	1.1	1.1	0.7
23	10	3.0	1.3	1.3	0.9

The solubility of sodium sulfate in aqueous ammonia solutions was determined by Belopolskii and Aleksandrov at  $5^\circ$ ,  $15^\circ$ , and  $25^\circ$  (1931), at  $0^\circ$  (1932) and the data at all four temperatures is given in (1943).

In a re-examination of the system Na<sub>2</sub>SO<sub>4</sub> - NaCl - H<sub>2</sub>O at 20°, Silber, 1957, 1958, reports finding a number of metastable hydrates: Na<sub>2</sub>SO<sub>4</sub>·6H<sub>2</sub>O, ·4H<sub>2</sub>O, ·3H<sub>2</sub>O, ·2H<sub>2</sub>O. The existence of ·5H<sub>2</sub>O and ·H<sub>2</sub>O are also considered "probable."

Sodium sulfate forms a discontinuous series of solid solutions with sodium selenate at 20° (Collet, 1949).

THE SYSTEM SODIUM SULFATE - SODIUM THIOSULFATE - WATER  
(Garrañ, 1926)

Saturation was obtained by constant agitation in a thermostat for from 3 to 24 hours. M. C. indicates mixed crystals and the formula following shows the major constituent; \* indicates metastable equilibrium.

# Na SODIUM

## THE SYSTEM SODIUM SULFATE - SULFURIC ACID - ETHYL ALCOHOL (Dunncliff and Hoon, 1926)

The authors studied the action of alcohol upon sodium hydrogen sulfate and found that the maximum concentration of acid obtained in the liquid phase was 17.75 per cent. With quantities of salt necessary to yield higher concentrations it was impossible to separate the liquid phase and the "Rest." Hence the system could not be further investigated by this method. They then studied the action of alcoholic sulfuric acid solutions upon sodium sulfate and sodium hydrogen sulfate. The experimental results are not presented in a manner which can be easily understood.

The effect of the addition of sodium sulfate (0.004 to 0.008 molar) on the mutual solubility of n-butyl alcohol and water is reported by Reber, McNabb, and Lucasse, 1942.

THE SYSTEM SODIUM SULFATE - TERTIARY BUTYL ALCOHOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

The points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in mixtures of weighed amounts of  $\text{Na}_2\text{SO}_4$  and one of the liquids, upon addition of weighed amounts of the other. Tie lines, \*, were located by determining the  $\text{Na}_2\text{SO}_4$  in two layers in contact with each other and from these the plait point, PP, was found by plotting.

50

The plait point of this system at 25° was found by Ginnings, Herring and Webb, 1933, to have the composition 2.8 percent  $\text{Na}_2\text{SO}_4$  + 31.4 percent  $(\text{CH}_3)_3\text{COH}$  + 65.8 percent  $\text{H}_2\text{O}$ .

Results for the plait point of the system sodium alum, tertiary butyl alcohol and water at 25° are given as 5.4 percent  $\text{NaAl}(\text{SO}_4)_2$  + 26.9 percent  $(\text{CH}_3)_3\text{COH}$  + 67.7 percent  $\text{H}_2\text{O}$  by Ginnings, Herring and Webb, 1933.

100 gms. 95 percent alcohol dissolve about 1.4 gms.  $\text{NaHSO}_4$  at 25°. (U.S.P. VIII)

100 gms. 95 percent formic acid dissolve 30 gms.  $\text{NaHSO}_4$  at 19.3°. (Aschan, 1913)

SOLUBILITY OF SODIUM SULFATE IN ETHYLENE GLYCOL SOLUTIONS  
(Vener and Thompson, 1949)

Only one liquid phase was found in the system. The results are in gms. of  $\text{Na}_2\text{SO}_4$  per 100 gms. saturated solution, and the density is listed in each case. The authors plotted their data and read the results from the smooth curves. In the original, results are given for 5° intervals.

THE SYSTEM  $\text{Na}_2\text{SO}_4$  - PYRIDINE - WATER

Binodal curves and plait points are given by Ginnings, Webb and Hinohara, 1933. Data for the conjugation curve in this system (at 30°) and in the system  $\text{Na}_2\text{SO}_4$  + 2 - picoline - water are given by Arakawa, Kawaguchi and Kato, 1958.

THE SYSTEM  $\text{Na}_2\text{SO}_4$  - ALIPHATIC AMINES - WATER AT 30°  
(Arakawa and Kawaguchi, 1958)

Compositions of the conjugate solutions are indicated for four primary aliphatic amines.

$\text{Na}_2\text{SO}_4 + \text{Na}_2\text{SiO}_3$	(Bergman, Nesterova and Bychkova, 1955)	SO
$\text{Na}_2\text{SO}_4 + \text{Na}_2\text{O}$	(Kohlmeier and Lohrke, 1955)	
$\text{Na}_2\text{SO}_4 + \text{ZnSO}_4$	(Evseeva, 1953)	
$\text{Na}_2\text{SO}_4 + \text{PbMoO}_4 = \text{Na}_2\text{MoO}_4 + \text{PbSO}_4$		

#### SODIUM PHENYL SULFATE $\text{C}_6\text{H}_5\text{O}_4\text{SHa} \cdot 3\text{H}_2\text{O}$

100 gms. sat. solution in water contain 31.0 gms. of the compound at 17°. 100 gms. sat. solution in alcohol contain 7.0 gms. of the compound at 17°. (Burkhardt and Lapworth, 1926.)

#### SODIUM H-PHENYL $\beta$ AMINOCETHYL HYDROGEN SULFATE $\text{C}_6\text{H}_5\text{HH} \cdot \text{C}_2\text{H}_4\text{OSO}_3\text{Na} \cdot \text{H}_2\text{O}$

100 cc. sat. solution in water contain approx. 60 gms. of the compound at 15°. (Saunders, 1922.)

#### SODIUM ALKYL SULFATES

For results on sodium lauryl sulfate in water at 25° see Williams, Phillips and Mysels, 1955; for sodium dodecyl sulfate see Phillips and Mysels, 1955.

#### SODIUM THIOSULFATE $\text{Na}_2\text{S}_2\text{O}_3$

##### SOLUBILITY IN WATER

A large number of hydrates have been identified. The results of Young and Burke, 1904, 1906 (first table) are in good agreement with those of Picon, 1924 (second table). Young and Burke adopted a new system of naming the hydrates, based upon their mutual transition relations. These transitions occur in such a way that the members of one group undergo transition into members of the same group and not into members of another group. Those hydrates belonging to group (I) are called primary hydrates, those belonging to group (II) are called secondary and

# Na SODIUM

those belonging to the (III), (IV) and (V) groups are called tertiary, quaternary and quintary respectively.

Commercial sodium thiosulfate is the primary pentahydrate,  $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$  (I).

## (Results of Picon, 1924)

This entire system has been reinvestigated by a method of determination involving the reheating of previously crystallized mixtures of accurately weighed amounts of the constituents, and observing the temperature of disappearance of the last crystal. The results are, with few exceptions, in very good agreement with the determinations of Young and Burke, 1904, 1906 (preceding table).

The plait point of the system sodium thiosulfate, tertiary butyl alcohol and water at 25° was found by Ginnings, Herring and Webb, 1933 to have the composition, 3.2 percent Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> + 33.6 percent (CH<sub>3</sub>)<sub>3</sub>COH + 63.2 percent H<sub>2</sub>O. The original results for the other points on the binodal curve are not given but only the values of constants calculated by means of an empirical equation.

The binodal curves and plait points of the systems:

sodium thiosulfate + allyl alcohol + water at 25°

and

sodium thiosulfate + pyridine + water at 25°

have been determined respectively by Ginnings and Dees, 1935, and Ginnings, Webb and Hinohara, 1933, but the experimental results are not given but only the values of a series of constants calculated by empirical equations.

Data for the lowering of the freezing-point of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>·5H<sub>2</sub>O by each of the following compounds: urea, glucose, cane sugar, NaCl, NaClO<sub>3</sub>, NaNO<sub>3</sub> and Na<sub>2</sub>SO<sub>4</sub> are given by Boutaric (1911).

An aqueous solution simultaneously saturated with sodium thiosulfate and urethan, contains 4.70 gm. mols. Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> + 0.132 gm. mols. NH<sub>2</sub>COOC<sub>2</sub>H<sub>5</sub> per 1000 gms. H<sub>2</sub>O at 25°. (Palitzsch, 1928, 1929.)

100 gms. alcohol dissolve 0.0025 gm. Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and 0.0034 gm. Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>·5H<sub>2</sub>O at room temperature. (Bödtker, 1897.)

100 gms. alcohol of 0.941 Sp. Gr. dissolve 33.3 gms. sodium thiosulfate at 15.5°.

SODIUM HYPOSULFITE  $\text{Na}_2\text{S}_2\text{O}_4$   
(HYDROSULFITE)

SO

SOLUBILITY IN WATER  
(Jellinck, 1911)

The pure sample was prepared by salting out the commercial product with NaCl. It is very easily oxidized to  $\text{Na}_2\text{S}_2\text{O}_5$  and must be kept in an indifferent atmosphere or a vacuum. A special apparatus was required for the freezing-point determinations (ice curve) and for the solubility determinations. Great difficulty was experienced in obtaining concordant results with a given sample of  $\text{Na}_2\text{S}_2\text{O}_4$ .

The binodal curves and plait points of the system  $\text{Na}_2\text{S}_2\text{O}_4$  - pyridine - water is given by Ginnings, Webb and Hinohara, 1933, but the authors do not give their experimental results but only the values of arbitrary constants calculated by means of empirical equations.

At 25° 1.34 gms.  $\text{Na}_2\text{S}_2\text{O}_4$  dissolve in 100 gms. of ethylene glycol.

At 25° 0.37 gms.  $\text{Na}_2\text{S}_2\text{O}_4$  dissolve in 100 gms. of propylene glycol. (Palit, 1947)

SODIUM PYROSULFITE  $\text{Na}_2\text{S}_2\text{O}_5$

SO

SOLUBILITY OF SODIUM PYROSULFITE IN WATER  
(Foerster, Brosch and Norberg-Schulz, 1924)

The determinations were made with exceptional care. Equilibrium was approached from above and below. A new preparation of the salt was used for each determination and the composition of the solid phase was determined by analysis in each case. In order to reduce the free sulfur dioxide present, the volume of air space above the saturated solution was kept at a minimum. The two hydrates give solubility curves which are almost parallel. The metastable hexahydrate is very easy to obtain and its equilibrium with the solutions can be readily followed.

## SeO SODIUM NEODYMIUM SELENATE NaNd(SeO<sub>4</sub>)<sub>2</sub>·2N<sub>2</sub>O

100 gms. H<sub>2</sub>O dissolve about 7 gms. of the salt (? anhydrous) at 0° and 7 gms. at 20°. (Meyer, Julius and Kittlemann, 1931.)

## SiO SODIUM SILICATES

### THE SYSTEM Na<sub>2</sub>O - SiO<sub>2</sub> - H<sub>2</sub>O

The system has been studied by a number of investigators, with only occasional agreement. Considerable difficulty has been encountered in obtaining equilibrium in the viscous, highly alkaline solutions. Separation of the solid and liquid phases is difficult and a variety of techniques have been employed. Many of the phases exist metastably and have been mistaken for other, stable solids. Although it is difficult to determine the correctness of any given data, Wills (1950) has reviewed the system critically, and has tabulated the "most probable" composite curve at 25°. This is given below; several isotherms at other temperatures follow this table, and are presented without detailed comment.

THE SYSTEM  $\text{Na}_2\text{O} - \text{SiO}_2 - \text{H}_2\text{O}$ --Cont."Most Probable" Isotherm at  $25^\circ$  (Wills, 1950)

### SOLUBILITY OF SODIUM SILICATE ( $\text{Na}_2\text{SiO}_3 \cdot 9\text{H}_2\text{O}$ ) IN AQUEOUS SODIUM HYDROXIDE AND SODIUM CHLORIDE SOLUTIONS (Vesterberg, 1912)

Solid phase  $\text{Na}_2\text{SiO}_3 \cdot 9\text{H}_2\text{O}$  in each case.

Solvent	t°	d <sub>17</sub> of Sat. Sol.	Gms. per 100 cc. Sat. Sol.			
			$\text{Na}_2\text{O}$	$\text{SiO}_2$	$= \text{Na}_2\text{SiO}_3 \cdot 9\text{H}_2\text{O}$	NaCl
Approx. 0.5 n NaOH	17.5	1.129	6.942	5.419	= 25.56	-
Approx. 0.5 n NaCl	17.5	1.150	7.347	7.172	33.83	2.297
Saturated NaCl Solution	19	1.258	4.563	4.376	20.64	27.91

Data for the solubility of  $\text{Na}_2\text{SiO}_3$  in aqueous NaCl (0-20%) and in aqueous  $\text{NaHCO}_3$  (0-7.5%) solutions was determined by Denisov and Belova, 1953. The solubility decreases in NaCl solutions and increases in aqueous  $\text{NaHCO}_3$ .

Data for the solubility of  $\text{Na}_2\text{SiO}_3$  in aqueous  $\text{Na}_2\text{CO}_3$  (1-20%) solutions was determined by Denisov and Bleshinshii, 1953. The solubility increases in more alkaline solutions.

Results for the rate of solution of vitreous sodium silicate glasses of different grain sizes were obtained by Matveev, 1949.

For data on the solubilities of clay, carbonates and argillaceous minerals in 0.1N HCl, 0.5 N acetic acid and other solutions, see Zalmazov and Shishova, 1950.

Melting points are given for:

$\text{Na}_2\text{SiO}_3 + \text{Na}_2\text{WO}_4$	(Van Klooster, 1910-11)
$\text{Na}_2\text{SiO}_3 + \text{SrSiO}_3$	(Wallace, 1901)
$\text{Na}_2\text{SiO}_3 + \text{PbSiO}_3 + \text{SiO}_2$	(Krakau, Mukhin and Heinrich, 1937)
$\text{Na}_2\text{SiO}_3 - \text{Na}_2\text{TiO}_3 - \text{TiO}_2$	(Belyaev and Sigida, 1958)

## SODIUM ALUMINOSILICATES

For data in aluminate solutions at 50° and 70° in which the ratio of each component was varied see Ni and Ponomarev, 1956.

## SODIUM STANNATE $\text{Na}_2\text{Sn}(\text{OH})_6$

SODIUM TELLURATE  $\text{Na}_2\text{TeO}_4$ 

100 gms.  $\text{H}_2\text{O}$  dissolve 0.77 gm.  $\text{Na}_2\text{TeO}_4$  at 18°, and 2 gms. at 100°. Solid phase  $\text{Na}_2\text{TeO}_4 \cdot 2\text{H}_2\text{O}$ .

100 gms.  $\text{H}_2\text{O}$  dissolve 1.43 gms.  $\text{Na}_2\text{TeO}_4$  at 18°, and 2.5 gms. at 50°. Solid phase  $\text{Na}_2\text{TeO}_4 \cdot \text{H}_2\text{O}$ .

SODIUM TITANATE  $\text{Na}_2\text{TiO}_3$ 

TiO

Melting points are given for:

$\text{Na}_2\text{TiO}_3 + \text{NaF}$  (Sholokovich, 1955)  
 $\text{Na}_2\text{TiO}_3 + \text{Na}_2\text{SO}_4, + \text{Na}_2\text{CrO}_4, + \text{Na}_2\text{MoO}_4, + \text{Na}_2\text{WO}_4,$   
 $+ \text{NaCl}, + \text{NaVO}_3, + \text{Na}_4\text{P}_2\text{O}_7$  (Sholokovich and Barkova, 1956)  
 $\text{Na}_2\text{TiO}_3 + \text{Li}_2\text{TiO}_3$  (Belyaev and Sigida, 1957)  
 $\text{Na}_2\text{TiO}_3 + \text{PbWO}_4, \text{PbMoO}_4$  (Belyaev, 1954)

SODIUM URANATES  $x\text{Na}_2\text{O} \cdot y\text{UO}_3$ 

UO

THE SYSTEM SODIUM OXIDE - URANIUM TRIOXIDE - WATER  
(Ricci and Loprest, 1954)

Only one pure solid sodium uranate phase ( $\text{Na}_2\text{O} \cdot 6\text{UO}_3$ ) was found after an extensive investigation at 50°. Three separate series of solid solutions exist, some hydrated, but none of simple composition; all solid phases are incongruently soluble. Data are also given at 75°, and confirm the findings at the lower temperature.

Na SODIUM

THE SYSTEM SODIUM OXIDE - URANIUM TRIOXIDE - WATER--Cont.

System  $\text{Na}_2\text{O}-\text{UO}_3-\text{H}_2\text{O}$ :  
tie-line relations at  $50^\circ$ ;  $u = \text{Na}_2\text{UO}_4$ ,  $v = \text{Na}_2\text{UO}_4 \cdot \text{H}_2\text{O}$  or  $2\text{NaOH} \cdot \text{UO}_3$

Schematic diagram of the phase relations at  $50^\circ$ .

Data for the system  $\text{Na}_2\text{O}-\text{UO}_2-\text{CO}_2-\text{H}_2\text{O}$  at  $26^\circ$  are given by Blake, et al., 1956.

SODIUM METAVANADATE  $\text{NaVO}_3$ SOLUBILITY IN WATER  
(MacAdam and Pierle, 1912)

Considerable time was required for attainment of equilibrium. The two solid phases appear to exist for the whole range of temperature and the conditions for the transformation of one into the other were not ascertained.

SODIUM PARATUNGSTATE  $5\text{Na}_2\text{O} \cdot 12\text{WO}_3 \cdot 28\text{H}_2\text{O}$ 

WO

SOLUBILITY OF SODIUM PARATUNGSTATE IN WATER  
(Vallance, 1931; Rosenheim and Wolff, 1930)

The original results in each case were plotted and the following figures taken from the curves. The solid phase was  $5\text{Na}_2\text{O} \cdot 12\text{WO}_3 \cdot 28\text{H}_2\text{O}$  in each case.

t°	Gms. $5\text{Na}_2\text{O} \cdot 12\text{WO}_3$ per 100 gms. sat. sol.		t°	Gms. $5\text{Na}_2\text{O} \cdot 12\text{WO}_3$ per 100 gms. sat. sol.

Melting points are given for:

$\text{Na}_2\text{WO}_4 + \text{WO}_3$	(Parravano, 1909; Van Liempt, 1925; Hoermann, 1929)
$\text{Na}_2\text{WO}_4 + \text{WO}_3 + \text{W}$	(Brimm, Brantly, Lorenz and Jellinek, 1951)
$\text{Na}_2\text{WO}_4 + \text{PbWO}_4$	(Belyaev, 1952)

SODIUM ZINCATE  $\text{Na}_2\text{ZnO}_2$ 

ZnO

THE SYSTEM  $\text{Na}_2\text{O} - \text{ZnO} - \text{H}_2\text{O}$  AT 30°  
(Goudriaan, 1919, 1920)

See data following for other results

Especially carefully purified materials were used. The solid phases were determined by the rest method of Schreinemakers. At the zinc hydroxide end of the curve crystallized  $\text{Zn}(\text{OH})_2$  was used as solid phase and about two weeks allowed for the attainment of final equilibrium.

## THE SYSTEM $\text{Na}_2\text{O} - \text{ZnO} - \text{H}_2\text{O}$ AT $30^\circ$ --Cont.

Gms. per 100 gms. sat. sol.

	$\text{Na}_2\text{O}$	$\text{ZnO}$	Solid Phase
	36.1	10.2	$\text{Na}_2\text{O} \cdot \text{ZnO} \cdot 4\text{H}_2\text{O}$
	39.2	9.7	" + $\text{Na}_2\text{O} \cdot 3\text{H}_2\text{O}$
	39.4	9.0	$\text{Na}_2\text{O} \cdot 3\text{H}_2\text{O}$
	39.6	7.2	"
	40.7	2.0	"
	40.5	1.6	"
	40.9	1.1	"
	41.9	0.0	"
ZnO	24.6	12.5	ZnO
	19.9	15.2	$\text{Zn}(\text{OH})_2$
	13.7	7.2	"
	10.1	4.7	"
	4.6	1.0	"
	4.5	0.4	ZnO

Other determinations of the equilibrium in this system, differing more or less from the above, are given by Müller, Müller and Fauvel, 1927, and by Scholder and Hendrich, 1939. These latter investigators found that at  $20^\circ$  the solid phase at concentrations of NaOH between 1 and 13.4 normality, was ZnO. At concentrations between 13.5 and 19.6 normality it was  $\text{Na}[\text{Zn}(\text{OH})_3]$  and at concentrations between 19.6 and 20.1 it was  $\text{Na}_2[\text{Zn}(\text{OH})_4]$ . Above 20.1 normality the solid phase consisted of mixtures of  $\text{Na}[\text{Zn}(\text{OH})_4]$  and  $\text{NaOH} \cdot \text{H}_2\text{O}$ . At concentration of NaOH between 7.3 and 13.3 normality there are also present rhombic  $\text{Zn}(\text{OH})_2$  and  $\text{Na}_3[\text{Zn}(\text{OH})_3] \cdot 3\text{H}_2\text{O}$  as metastable solid phases. Less complete results at  $30^\circ$ ,  $40^\circ$  and  $100^\circ$  are also given.

More recent data by Urazov, Lipshits and Lovchikov, 1956 agree with those of Scholder and Hendrich, 1939. At  $25^\circ$ , Urazov found  $\text{Zn}(\text{OH})_2$  stable in solutions containing up to 11.4%  $\text{Na}_2\text{O}$ ; from 11.4 to 24.76%  $\text{Na}_2\text{O}$ , ZnO was the saturating phase; and from 24.76 to 29.54%  $\text{Na}[\text{Zn}(\text{OH})_3]$ . At  $75^\circ$  the phases are 0-32%  $\text{Na}_2\text{O}$  (ZnO); 32.2-44.8%  $\text{Na}[\text{Zn}(\text{OH})_3]$ ; 44.8-55%  $\text{Na}_2\text{Zn}(\text{OH})_4$ . At the boiling point maximum solubility of ZnO (23.5%) is in 56% NaOH. The solid phase at this point is  $4[2\text{ZnO} \cdot \text{Na}_2\text{O}] \cdot 3\text{H}_2\text{O}$ .

## SODIUM FLUOZIRCONATE $5\text{NaF} \cdot \text{ZrF}_4$

100 gms.  $\text{H}_2\text{O}$  dissolve 0.387 gm. at  $18^\circ$ , and 1.67 gms. at  $100^\circ$ . (Marignac, 1861)

NIOBIMUM CARBIDE

C

Continuous solid solutions are formed with titanium and zirconium carbides. (Koval'skii and Umanskii, 1946)

NEODYMIUM ACETATE  $\text{Nd}(\text{CH}_3\text{COO})_3 \cdot \text{H}_2\text{O}$ 

CH

100 gms. sat. sol. of neodymium acetate in water contain 20.76 gms.  $\text{Nd}(\text{CH}_3\text{COO})_3$  at 25°. Constant agitation was employed for obtaining saturation. (Meyer and Miller, 1920)

100 ml. sat. sol. of neodymium acetate in ethylenediamine contain 7.81 gms.  $\text{Nd}(\text{CH}_3\text{COO})_3$  at 30°. (Muniyappan and Anjaneyalu, 1957)

NEODYMIUM GLYCOLATE  $\text{Nd}(\text{C}_2\text{H}_3\text{O}_3)_3$ 

One liter  $\text{H}_2\text{O}$  dissolves 4.609 gms. salt at 20°. (Jantsch and Grünkraut, 1912-13)

NEODYMIUM LACTATE  $\text{Nd}(\text{C}_3\text{H}_5\text{O}_3)_3 \cdot 2\frac{1}{2}\text{H}_2\text{O}$ 

One liter of sat. solution of neodymium lactate in water contains 24.775 gms.  $\text{Nd}(\text{C}_3\text{H}_5\text{O}_3)_3 \cdot 2\frac{1}{2}\text{H}_2\text{O}$  at 20°. Saturation was secured by constant agitation. (Jantsch, 1926)

## NEODYMIUM BENZENE SULFONATES

[See also Vol. I, p. 1001 under DIDYMIUM]

## SOLUBILITY IN WATER

Sulfonate and Formula	t°	Gms. Anhydrous Salt per 100 gms. $\text{H}_2\text{O}$	Authority

SOLUBILITY OF NEODYMIUM TRICHLORIDE AND OF NEODYMIUM OXIDE IN AQUEOUS  
SOLUTIONS OF AMMONIUM CHLORIDE AT 15°, 30°, 50° AND 100°  
(Prandtl and Rauchenberger, 1920)

The results are given only in the form of small scale diagrams and it is stated that the numerical data will be published in full in the dissertation of Johanna Rauchenberger, University of München, 1920. The equilibrium  $\text{Nd}(\text{OH})_3 + 3\text{NH}_4\text{Cl} \rightleftharpoons \text{NdCl}_3 + 3\text{NH}_3 + 3\text{H}_2\text{O}$  was approached by the authors from both sides. The composition of the basic chlorides obtained by shaking the oxide with 1.0n  $\text{NH}_4\text{Cl}$  at different temperatures, and drying over soda lime, was approximately as follows:

At 15°

At 30°

At 50°

100 gms. abs. alcohol dissolve 44.5 gms. (anhydrous)  $\text{NdCl}_3$  at 20°. Saturation was obtained by spontaneous evaporation of the solution over  $\text{H}_2\text{SO}_4$ . (Matignon, 1906)

100 gms. anhydrous pyridine dissolve 1.8 gms. anhydrous  $\text{NdCl}_3$  at about 15°. Saturation obtained by daily agitation of the solution for some weeks. (Matignon, 1906)

## Nd NEODYMIUM

Melting points in the systems  $\text{NdCl}_3 - \text{NaCl}$ ,  $\text{NdCl}_3 - \text{CaCl}_2$  and  $\text{NdCl}_3 - \text{NaCl} - \text{CaCl}_2$  are given by Morozov, Shevtsova and Kiyukina, 1957.

### NEODYMIUM HEXA ANTIPYRINE PERCHLORATE $[\text{Nd}(\text{COC}_{10}\text{H}_{12}\text{O}_2)_6](\text{ClO}_4)_3$

100 cc. sat. solution of neodymium hexa antipyrine perchlorate in water contain 0.98 gm.  $[\text{Nd}(\text{COC}_{10}\text{H}_{12}\text{O}_2)_6](\text{ClO}_4)_3$  at 20°. (Wilke-Dörfurt and Schliephake, 1925.)

### NEODYMIUM CHROMATE $\text{Nd}_2(\text{CrO}_4)_3 \cdot 8\text{H}_2\text{O}$

100 gms. sat. solution of neodymium chromate in water contain 0.027 gm.  $\text{Nd}_2(\text{CrO}_4)_3$  at 25°. (Britton, 1924.)

## I NEODYMIUM IODIDE $\text{NdI}_3$

At 30°, 2.53 gms.  $\text{NdI}_3$  dissolve in 100 gms. ethylene diamine. (Moeller and Zimmerman, 1953.)

### NEODYMIUM MOLYBDATE $\text{Nd}_2(\text{MoO}_4)_3$

One liter  $\text{H}_2\text{O}$  dissolves 0.0186 gm. salt at 28° and 0.0308 gm. at 75°. The mixtures were frequently stirred at constant temperature during only two hours. (Hitchcock, 1895.)

## NO NEODYMIUM NITRATE $\text{Nd}(\text{NO}_3)_3$

[See also Vol. I, p. 1000 under DIDYMIUM]

## Nd NEODYMIUM

SOLUBILITY IN AQUEOUS  $\text{HNO}_3$  OF  $d_{16} = 1.325$  (= 51.59 GMS.  $\text{HNO}_3$  PER 100 CC.)  
AT  $16^\circ$   
(Jantsch, 1912)

Double Salt	Formula	Gms. Hydrated Double Salt per 100 Gms. Sat. Sol.
Neodymium Magnesium Nitrate	$[\text{Nd}(\text{NO}_3)_6]_2\text{Mg}_3 \cdot 24\text{H}_2\text{O}$	97.7
" Nickel "	" $\text{Ni}_3$ "	116.6
" Cobalt "	" $\text{Co}_3$ "	151.6
" Zinc "	" $\text{Zn}_3$ "	177
" Manganese "	" $\text{Mn}_3$ "	296

The distribution coefficient of a mixture of rare earth nitrates containing 12.5% neodymium nitrate between methyl n-hexyl ketone and water at room temperature was found to be less than 0.0012, with 33.0% of anhydrous salt in the aqueous phase. (Rothchild; Templeton, and Hall, 1948.)

Data for the distribution of  $\text{Nd}(\text{NO}_3)_3$  between tri n-butyl phosphate and aqueous  $\text{HNO}_3$  are given by Knapp, Smutz and Spedding, 1956 and by Weaver, Kappelmann and Topp, 1953.

100 cc. of a saturated solution of  $\text{Nd}(\text{NO}_3)_3$  in ethyl ether, prepared by frequent agitation and allowing to stand over night at about  $20^\circ$ , contain 0.20 gm.  $\text{Nd}_2\text{O}_3$ . A saturated ethereal solution prepared as above but using neodymium nitrate which had been dehydrated at  $150^\circ$ , contain 2.67 gm.  $\text{Nd}_2\text{O}_3$  per 100 cc. of solution. (Wells, 1930.)

### DISTRIBUTION OF NEODYMIUM NITRATE BETWEEN WATER AND n-HEXYL ALCOHOL AT $25^\circ$

The solubility of Ne in nitroethane at  $24.85^\circ$  is  $\beta$  = 0.0245 (Friedman, 1954).

## Ne NEON

Data for the solubility of Ne and He in liquid argon at 83.9 to 87.5°K are given by Karasz and Halsey, Jr. (1958).

Results for the solubility of Ne, Ar, He and Xe in NaF - ZrF<sub>4</sub> melts at 600-800° are given by Grimes, Smith and Watson, 1958.

Data for the solubility of Ne in polyvinyl acetate from 8° to 40° are reported by Meares, 1958.

## NICKEL Ni

Qualitative data showing that just as iron, nickel is considerably attacked by water containing carbon dioxide, with formation of nickel carbonate, are given by Robl, 1924. A few quantitative results for special conditions are given.

Data for the distribution of nickel between zinc and lead are given by Tammann and Schaftmeister, 1924.

### SOLUBILITY OF NICKEL IN MILK (Quam, 1929)

Highly polished 4 x 7.5 cm. strips of nickel were each immersed in 50 cc. portions of raw milk and rocked 46 times per minute for one-half hour. The loss in weight of the Ni strips was determined and expressed as milligrams Ni dissolved per square decimeter of surface exposed. The dissolved nickel was also determined in the ash of the 50 cc. of milk by a modification of the  $\alpha$  benzil dioxane method. "

t°	Mgs. Ni dissolved per sq. decimeter of metal	t°	Mgs. Ni dissolved per sq. decimeter of metal
20	0.86	75	6.54
30	1.22	80	6.54
45	3.442	85	5.17
55	4.31	90	3.442
62.8	5.85	95	1.22

### SOLUBILITY OF NICKEL IN MERCURY (Irvin and Bussell, 1932)

An amalgam prepared from 0.2 gm. Ni in about 200 gms. Hg by electrolysis was filtered after two days through its own paste on a ground glass filter and the dissolved nickel in this filtrate found to be less than 0.00002 gm. per 100 gms. Hg. A determination by Tammann, Kollmann and Hinnuber, 1927, by potential difference measurements gave the result 0.0057 gm. mol. Ni per 1.0 gm. mol. Hg at 15°.

## AsO NICKEL ARSENITE

Data for the solubility of nickel arsenite at 20° in HNO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub> and HCl solutions at pH2-3 are given by Chukhlantsev, 1957.

## NICKEL ARSENATE

AsO

The Ksp of  $\text{Ni}_3(\text{AsO}_4)_2$  at  $20^\circ$  is  $3.1 (\pm 2.4) \times 10^{-26}$  at  $20^\circ$ , as determined in dilute  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  solutions. (Chukhlantsev, 1956)

NICKEL BORATE  $\text{NiB}_6\text{O}_{10} \cdot 10\text{H}_2\text{O}$ 

BO

The solubility in 3% aqueous  $\text{H}_3\text{BO}_3$  at  $0^\circ$  is 45 gm. per liter. (Krymova, 1955.)

NICKEL BROMIDE  $\text{NiBr}_2 \cdot 6\text{H}_2\text{O}$

## NI NICKEL

### BrO NICKEL BROMATE $\text{Ni}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$

100 gms. cold water dissolve 27.6 gms. nickel bromate.

### CH NICKEL ACETATE $\text{Ni}(\text{CH}_3\text{COO})_2$

The mean of four determinations of the solubility of nickel acetate in pure acetic acid, by Davidson and Chappell, 1933, was 12.37 mol. percent  $\text{Ni}(\text{CH}_3\text{COO})_2$  at  $30^\circ$ . The solid phase consisted of a finely divided greenish white substance without crystalline structure and containing from 54 to 66 mol. percent  $\text{Ni}(\text{CH}_3\text{COO})_2$ , thus indicating a solvated product of variable composition. Freezing-point determinations of  $\text{Ni}(\text{CH}_3\text{COO})_2 + \text{CH}_3\text{COOH}$  mixtures are also given.

### NICKEL $\beta$ METHYLADIPATE

100 cc. of sat. solution of neutral nickel racemic  $\beta$  methyladipate in water, contain 7.3 gms. of the salt at  $20^\circ$ . (Meurisse.)

### NICKEL CITRATE $\text{Ni}_3[(\text{COOCH}_2)_2\text{C}(\text{OH})\text{COO}]_2 \cdot 2\text{H}_2\text{O}$

100 cc. sat. solution in water contain 0.28 gm. Ni = 0.94 gm. anhydrous salt at  $10^\circ$ . (Pickering, 1915.)

### NICKEL POTASSIUM CITRATE $\text{K}_4\text{Ni}[(\text{COOCH}_2)_2\text{CONHCOO}]_2$

100 cc. sat. sol. in water contain 3.9 gms. Ni = 41 gms. salt at  $10^\circ$ . (Pickering, 1915.)

### NICKEL MALATE $\text{Ni}[\text{CH}_2\text{CHOH}(\text{COO})]_2 \cdot 3\text{H}_2\text{O}$

100 cc. sat. solution in water contain 0.02 gm. Ni = 0.06 gm. salt at  $10^\circ$ . (Pickering, 1915.)

### NICKEL FUMARATE $\text{Ni} \cdot \text{C}_4\text{H}_2\text{O}_4 \cdot 5\text{H}_2\text{O}$

100 gms.  $\text{H}_2\text{O}$  dissolve 0.36 gm.  $\text{NiC}_4\text{H}_2\text{O}_4$  at  $30^\circ$ . (Weiss and Downs, 1923.)

**NICKEL XANTHATE**  
(XANTHOGENATE)  $(C_2H_5OCSS)_2Ni$

The solubility in water is  $6.3 \times 10^{-5}$  gms./100 ml. solution.  
(Sheka and Kriss, 1957.)

The Ksp is  $3.5 \times 10^{-18}$ . (Oyama, et al., 1957.)

**NICKEL RUBEANATE**  $Ni(HMSSCSNH) ?$

The Ksp in water as determined in dilute electrolytes is  $1.1 \times 10^{-15}$ . (Malyuga, 1955.)

**NICKEL AMINO ACID SALTS**

CH

**SOLUBILITY IN WATER AND METHANOL AT 24.5°**  
(Lang, 1939)

Amino Acid	Salt Formula	Gms. Salt per 100 gms. Sat. Sol.	
		In Water	In Methanol
Glycine	$Ni(C_2H_4O_2N)_2 \cdot 2H_2O$	2.74	0.009
d, l Alanine	$Ni(C_3H_5O_2N)_2 \cdot 2H_2O$	0.91	.020
d, l Amino Butyric	$Ni(C_4H_7O_2N)_2 \cdot 2H_2O$	2.23	.027

d, l - Asparagine		-	.225

**NICKEL DIMETHYLGLYOXIME**  $Ni(CH_3C(NOH)C(NO)CH_3)_2$

**SOLUBILITY OF NICKEL DIMETHYLGLYOXIME IN AQUEOUS SALT SOLUTIONS AT 25°**  
(Christopher and Sandell, 1954)

Solution	pH	Micrograms Ni per liter
0.05 M Ammonium acetate	6.7	56
0.05 M Sodium bicarbonate	8.9	57
2.0 M Sodium chloride	6.8	29
H <sub>2</sub> O saturated with CHCl <sub>3</sub>	-	69

## NI NICKEL

The following data show the effect of pH on the solubility of nickel dimethylglyoxime in HCl - KCl solutions of 0.05 M ionic strength:

pH	Total Ni conc'n. moles per liter	pH	Total Ni conc'n. moles per liter
2.155	0.01034	2.77	0.00065
2.295	0.00595	3.185	0.000084
2.46	0.00272	3.64	0.000011
2.495	0.00245	4.29	0.0000017
2.98	0.00125		

From the above data  $K_{sp} = 4.2 - 5.1 \times 10^{-24}$ . Babko and Mikhel'son, 1951 found  $2 \times 10^{-25}$  in buffer mixtures at pH 3 and 3.5.

### SOLUBILITY OF NICKEL DIMETHYLGLYOXIME IN AQUEOUS ETHANOL AT 20-22° (Babko and Mikhel'son, 1955)

Wt. % C <sub>2</sub> H <sub>5</sub> OH	Ni(HD) <sub>2</sub> moles per liter	Wt. % C <sub>2</sub> H <sub>5</sub> OH	Ni(HD) <sub>2</sub> moles per liter
9.6	0.003	57.6	0.018
19.2	0.004	67.2	0.019
28.3	0.006	76.8	0.019
38.4	0.010	86.4	0.020
48.0	0.015	96	0.021

The solubility of nickel dimethyl glyoxime in chloroform at 25° is 0.141 gms. per liter. (Christopher and Sandell, 1954.)

Data for the solubility of nickel cyclohexanedione dioxime and nickel cycloheptanedione dioxime in water are given by Saggese, 1954.

### NICKEL GLUCONATE $Ni(C_6H_{11}O_7)_2 \cdot 3H_2O$

100 cc. sat. solution of nickel gluconate in water contain 9.65 gms.  $Ni(C_6H_{11}O_7)_2$  at 25°. (May, Weisberg and Herrick, 1929.)

### NICKEL BENZOATE $Ni(C_6H_5COO)_2 \cdot 3H_2O$

### NICKEL CHLOR, OXY AND NITRO BENZOATES

#### SOLUBILITY OF EACH SEPARATELY IN WATER AT 20° (Ephraim and Pfister, 1925)

Compound	Formula	Gms. anhydrous compd. per 100 cc. sat. sol.
Nickel Benzoate	$Ni(C_6H_5 \cdot COO)_2 \cdot 3H_2O$	1.291
Nickel-4-Chlor Benzoate	$Ni(C_6H_4 \cdot Cl \cdot COO)_2 \cdot 4H_2O$	0.660
Nickel-4-Oxy Benzoate	$Ni(C_6H_4 \cdot OH \cdot COO)_2 \cdot 7H_2O$	0.871
Nickel-4-Nitro Benzoate	$Ni(C_6H_4 \cdot NO_2 \cdot COO)_2 \cdot 8H_2O$	0.777

100 gms. methyl alcohol ( $\text{CH}_3\text{OH}$ ) dissolve 0.29 gm.  $\text{Ni}(\text{C}_6\text{H}_5\text{COO})_2$  at  $15^\circ$  and 0.30 gm. at  $66^\circ$  (b.pt.). (Henstock, 1934.)

### NICKEL NITROSO $\beta$ PHENYL HYDROXYLAMINE $\text{Ni}[\text{C}_6\text{H}_5\cdot\text{N}(\text{NO})\cdot\text{O}]_2$

The compound is prepared by precipitating cupferron (the ammonium salt of nitroso phenyl hydroxylamine) with a nickel salt.

One liter sat. solution of the compound in water contains 0.00089 gm. at. (= 0.052 gm.)  $\text{Ni}[\text{C}_6\text{H}_5\cdot\text{N}(\text{NO})\cdot\text{O}]_2$  at  $18^\circ$ . (Pinkus and Martin, 1927.)

### NICKEL CINNAMATE $\text{Ni}\cdot\text{C}_{18}\text{H}_{14}\text{O}_4\cdot 2\text{H}_2\text{O}$

100 cc. sat. sol. of nickel cinnamate in water contain 0.293 gm.  $\text{NiC}_{18}\text{H}_{14}\text{O}_4$  at  $20^\circ$ . (Ephraim and Pfister, 1925.)

### NICKEL HELIANTHATE $\text{Ni}(\text{C}_{14}\text{H}_{14}\text{N}_3\text{SO}_3)_2\cdot 4\text{H}_2\text{O}$

CH

1000 cc.  $\text{H}_2\text{O}$  dissolve 0.072 gms. of the salt at  $20\text{--}25^\circ$ . (Stark and Dohn, 1918.)

### NICKEL ANTHRACENE, BENZENE AND NAPHTHALENE SULFONATES

#### SOLUBILITY OF EACH SEPARATELY IN WATER

(Ephraim and Pfister, 1925, 1925a; Ephraim and Seger, 1925)

Compound and Formula	t°	Gms. anhydrous empd. per 100 cc. sat. sol.
Nickel Anthracene-1-sulfonate $\text{Ni}(\text{C}_{14}\text{H}_9\text{SO}_3)_2\cdot 6\text{H}_2\text{O}$	20	0.0253

Nickel o Xylol Sulfonate $\text{Ni}[(\text{CH}_3)_2(1,2)\text{C}_6\text{H}_3\text{SO}_3(4)]_2 \cdot 6\text{H}_2\text{O}$	16	3.63

## NICKEL 8-HYDROXYQUINOLATES

The Ksp of nickel 8-hydroxyquinolate at room temperature is  $5.6 \times 10^{-23}$ . The Ksp of nickel 8-hydroxy-2-methyl quinolate at room temperature is  $6.3 \times 10^{-21}$ . (Borrel and Paris, 1952.)

Data for the extraction of nickel by 8-hydroxyquinoline in chloroform are given by Moeller, 1943 and by Gentry and Sherrington, 1950. In the later case tartrate ions were present in the water.

The solubility product of nickel 8-hydroxyquinolin-5-sulfonic acid was determined by Nasanen and Uusitalo, 1954.

NICKEL SALICYLOENIMINE  $\text{Ni}(\text{HN}=\text{CNC}_6\text{H}_4)_2$ SOLUBILITY IN VARIOUS SOLVENTS  
(Alimarin and Koreneva, 1955)

This complex is prepared from salicylaldehyde and ammonia +  $\text{Ni}^{++}$ .

Solvent	Mg. Ni per ml.	Solvent	Mg. Ni per ml.
Benzyl alcohol	0.505	diethyl ether	0.015
i-Amyl alcohol	0.030	dibenzyl	0.065

(Cont.)

## NI NICKEL

Solvent	Mg. Ni per ml.	Solvent	Mg. Ni per ml.
Amyl acetate	0.032	Ethylene dichloride	0.041
Cyclohexanone	0.2	Butyl bromide	0.011
Acetophenone	0.15	Carbon tetrachloride	0.004
Acetone	0.05	Benzene	0.016

## NICKEL ANTRAQUINONE 1,5 DISULFINIC ACID $\text{Ni}(\text{C}_{14}\text{H}_6\text{O}_2(\text{SO}_2)_2)$

### SOLUBILITY IN WATER (Kozlov and Smolin, 1949)

t°	Solubility	Solid Phase
20	one part in 340 of $\text{H}_2\text{O}$	$\text{Ni}(\text{C}_{14}\text{H}_6\text{O}_2(\text{SO}_2)_2) \cdot 5\text{H}_2\text{O}$
100	one part in 165 of $\text{H}_2\text{O}$	"

## CN NICKEL CYANIDE $\text{Ni}(\text{CN})_2$

### SOLUBILITY IN WATER

18°	0.000535 mole $\text{Ni}(\text{CN})_2$ per liter	(Masaki, 1931)
25°	0.000082 mole $\text{Ni}(\text{CN})_2$ per liter	(Hume and Kolthoff, 1950)

The latter authors show that the formula of the salt is actually  $\text{Ni}[\text{Ni}(\text{CN})_4]$ .

## NICKEL FERROCYANIDE $\text{Ni}_2\text{Fe}(\text{CN})_6$

A saturated solution in water contains  $2.0 \times 10^{-5}$  gm. ions  $\text{Ni}^{++}$  per liter. (Tananaev, Glushkova and Seifer, 1956.)

## NICKEL NITROPRUSSIATE $\text{NiFe}(\text{CN})_5\text{NO}$

One liter sat. solution of nickel nitro prussiate in water contain 0.00006 gm. mol.  $\text{NiFe}(\text{CN})_5\text{NO}$  at 20°. (Tomicek and Kubik, 1937.) A previous determination by Zuccari, 1914, 1915, gave 0.1 gm.  $\text{NiFe}(\text{CN})_5\text{NO}$  per liter of water which is about six times the present value.

## SCN NICKEL THIOCYANATE $\text{Ni}(\text{SCN})_2$

100 gms. sat. solution in water contain 35.48 gms.  $\text{Ni}(\text{SCN})_2$  at 25°. (de Sweemer, 1932.) The author also gives results for the systems  $\text{Ni}(\text{SCN})_2 + \text{KSCN} + \text{H}_2\text{O}$  and  $\text{Ni}(\text{SCN})_2 + \text{Co}(\text{SCN})_2 + \text{H}_2\text{O}$  at 25°.

NICKEL CARBONATE  $\text{NiCO}_3$ 

CO

SOLUBILITY OF NICKEL CARBONATE IN WATER  
(Smurov, 1938)The total pressure of  $\text{CO}_2 + \text{H}_2\text{O}$  was one atmosphere.

Partial Pressure $\text{CO}_2$ in atm.	Gms. Ni per 100 gms. Sat. Sol.				
	5°	15°	40°	50°	80°
0.0005	0.0168	0.0136	0.0061	0.0037	0.0007

NICKEL OXALATE  $\text{NiC}_2\text{O}_4$ 

CO

## SOLUBILITY IN WATER

The solid phase is  $\text{NiC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ .

t°	Gms. $\text{NiC}_2\text{O}_4$ per liter sat. sol.	Reference
18	0.003	Scholder, Gadenne and Niemann, 1927
20	0.041	LeDrut and Hauss, 1937
25	0.0118	Berney, Argersinger and Reynolds, 1951

SOLUBILITY OF NICKEL OXALATE IN AQUEOUS SOLUTIONS OF FORMIC ACID AT 20°  
(LeDrut and Hauss, 1937)

The saturated solutions were analyzed by warming on the steam bath with excess of  $\text{H}_2\text{SO}_4$  to eliminate the  $\text{HCOOH}$  and titrating with 0.001n  $\text{KMnO}_4$ .

Gms. $\text{HCOOH}$ per 100 gms. solvent	Gms. $\text{NiC}_2\text{O}_4$ per liter sat. sol.	Solid Phase
0.0 ( = $\text{H}_2\text{O}$ )	0.041	$\text{NiC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$
25.0	0.022	"
50.0	0.028	"
95.0	0.100 (1)	"
100.0	0.075	"

(1) per 1000 gms. sat. solution. (Aschan, 1913.)

SOLUBILITY IN AQUEOUS  $\text{K}_2\text{C}_2\text{O}_4$  SOLUTIONS

When  $\text{K}_2\text{C}_2\text{O}_4$  is added to aqueous  $\text{NiC}_2\text{O}_4$  solutions, a minimum in solubility occurs: (Data of Berney, Argersinger and Reynolds, 1951 at 25°)

Moles per liter $\text{K}_2\text{C}_2\text{O}_4$ :	0	$5.4 \times 10^{-4}$	$4 \times 10^{-3}$
Moles per liter $\text{NiC}_2\text{O}_4$ :	$7.15 \times 10^{-5}$	$1.68 \times 10^{-5}$ (minimum)	$3.8 \times 10^{-5}$

When 1 gm. of nickel, as chloride, is dissolved in 100 cc. of 10% aq. HCl and shaken with 100 cc. of ether, 0.01 per cent of the nickel enters the ethereal layer. (Mylius, 1911.)

## NI NICKEL

The extraction of  $\text{NiCl}_2$  by ether from aqueous solutions with acid without HSCN was studied by Bock, 1951.

100 cc. of a mixture of equal volumes of diethyl ether and water, saturated with HCl at  $0^\circ$  will dissolve 0.0029 gms.  $\text{NiCl}_2$ . (Fischer and Seidel, 1941.)

Distribution data for  $\text{NiCl}_2$  between  $\text{H}_2\text{O}$  and tributyl phosphate at  $25^\circ$  and  $50^\circ$  are reported by Chatelet and Nicaud, 1956.

### SOLUBILITY OF NICKEL CHLORIDE IN ORGANIC SOLVENTS AT $25^\circ$ (Garwin and Hixson, 1949)

Data for the partition of NiF between aqueous HF solutions (1-20N) and ethyl ether at 20° are given by Bock and Hermann, 1956.

Less than 0.002 gm. Ni are present in 100 gms. of sat. sol. of NiF<sub>2</sub> in BrF<sub>3</sub> at 25°; less than 0.001 gm. Ni at 70°. (Sheft, Hyman and Katz, 1953.)

NICKEL HEXA ANTIPYRINE FLUOROBORATE [Ni(COC<sub>10</sub>H<sub>12</sub>N<sub>2</sub>)<sub>6</sub>](BF<sub>4</sub>)<sub>2</sub>

100 cc. sat. solution of the salt in water contain 4.8 gm. [Ni(COC<sub>10</sub>H<sub>12</sub>N<sub>2</sub>)<sub>6</sub>](BF<sub>4</sub>)<sub>2</sub> at 20°. (Wilke-Dörfurt and Mureck, 1929.)

# NI NICKEL

## NICKEL FLUOPHOSPHATE $[\text{Ni}(\text{NH}_3)_6][\text{PF}_3]_2$

At 21° the solubility in water is 0.0018 moles per liter. (Lange and Mueller, 1930.)

Solubility results for a long series of organic nickel fluo-phosphates in water are given by Lange and Mueller, 1930.

## I NICKEL IODIDE $\text{NiI}_2$

### SOLUBILITY IN WATER (Etard, 1894)

t°	Gms. $\text{NiI}_2$ per 100 Gms. Solution	t°	Gms. $\text{NiI}_2$ per 100 Gms. Solution	t°	Gms. $\text{NiI}_2$ per 100 Gms. Solution
-20	52.0	25	60.7	60	64.8
0	55.4	30	61.7	70	65.0
10	57.5	40	63.5	80	65.2
20	59.7	50	64.7	90	65.3

By interpolation the transition point for  $\text{NiI}_2 \cdot 6\text{H}_2\text{O} + \text{NiI}_2 \cdot 4\text{H}_2\text{O}$  is at 43°.

### SOLUBILITY OF NICKEL AMMONIUM IODIDE AT 20° IN:

Nitrobenzene		Acetonitrile	
moles iodine per mole nitrobenzene	moles iodine per mole of ammine in sat. sol.	moles iodine per mole acetonitrile	moles iodine per mole of ammine in sat. sol.

<sup>a</sup>saturated system

The organic layer of a solution of Ni(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O in tri-n-butyl phosphate at 25-27° contains 10.5 gms. Ni(NO<sub>3</sub>)<sub>2</sub> per 100 gms. sat. sol. (Wendlandt and Bryant, 1955.)

## NI NICKEL

100 gms. sat. solution in glycol contain 7.5 gms.  $\text{Ni}(\text{NO}_3)_2$  at room temperature. (de Coninck.)

100 cc. anhydrous hydrazine dissolve 3 gms.  $\text{Ni}(\text{NO}_3)_2$  at room temperature. (Welsh and Broderson, 1915.)

## O NICKEL OXIDE $\text{NiO}$

At  $500^\circ\text{C}$ , 1000 atm. 0.002%  $\text{NiO}$  dissolve in steam. At  $600^\circ$ , 1000 atm. 0.0034% dissolve. (Morey, listed by Ellis and Fyfe, 1957.)

## OH NICKEL HYDROXIDE $\text{Ni}(\text{OH})_2$

The solubility product is given as  $2.1 \times 10^{-17}$  by Britton (1935),  $1.6 \times 10^{-14}$  by Wijs (1925),  $6.5 \times 10^{-16}$  by Gayer and Garrett (1949), and  $6.2 \times 10^{-16}$  (Thermodynamic) by Nasanen (1943),  $1.36 \times 10^{-15}$  by Aksel'rud and Fialkov, 1950,  $1.0\text{--}1.8 \times 10^{-16}$  by Jena and Prasad, 1956. The solubility in moles per liter is  $1 \times 10^{-4}$  (Almkvist, 1918 at  $20^\circ$ ) also (Gayer and Garrett, 1949 at  $25^\circ$ );  $9.3 \times 10^{-6}$  (Oka, 1940).

### SOLUBILITY OF NICKEL HYDROXIDE IN SOLUTIONS OF $\text{HCl}$ AND $\text{NaOH}$ AT $25^\circ$ (Gayer and Garrett, 1949)

Moles per 1000 gms. $\text{H}_2\text{O}$		Moles per 1000 gms. $\text{H}_2\text{O}$			
$\text{NaOH}$	$\text{Ni}(\text{OH})_2$	$\text{HCl}$	$\text{Ni}(\text{OH})_2$	$\text{HCl}$	$\text{Ni}(\text{OH})_2$

15.00	$5 \times 10^{-6}$				

### SOLUBILITY OF $\text{Ni}(\text{OH})_2$ IN AQUEOUS $\text{NH}_3$ SOLUTIONS

#### Results of Paris, 1951 at $16^\circ$

Equiv. per liter:

$\text{NH}_3$	0.62	1.12	1.85	2.53	3.06	4.88	6.32	10.20
Ni	0.004	0.009	0.035	0.056	0.067	0.127	0.185	0.330

Other results in aqueous ammonia solutions are reported by Arkipov, Pakshver and Podbornova (1950) (also in aqueous  $\text{NaOH}$ ), Shaw and Ghosh (1950, 1951). For earlier work see Bonsdorff, 1904.

NICKEL PYROPHOSPHATE  $\text{Ni}_2\text{P}_2\text{O}_7$ 

PO

For Ksp and complex formation data see Yatsimirskii and Vasil'ev, 1956.

## NICKEL SULFIDE NiS

S

Attention is called by Kolthoff, 1931, to the incorrectness of the results of Weigel, 1906, for the solubility of nickel sulfide in water. It is considered that the values for the solubilities of most sulfides in water are of small or no practical importance. It is recommended that the relations between the solubility and the hydrogen ion and hydrogen sulfide concentrations be expressed by the reaction constant.

Danges (1947) determined the amount of NiS which dissolved under varying conditions of time, reagents added ( $\text{H}_2\text{S}$ ,  $\text{Na}_2\text{S}$ ,  $(\text{NH}_4)_2\text{S}$ ) and the concentration of added reagent.

The best value for Ksp is  $2 \times 10^{-21}$  (Goates, Gordon and Faux, 1952.)

1000 cc. of sat. solution of nickel sulfide in aqueous 2.0 normal sulfuric acid contain 0.0094 gm. NiS at 20°. (Moser and Behr, 1924.)

Melting points are given for:

$\text{Ni}_2\text{S}_3 + \text{Ni}$	(Chizhikov, Gulyanitskaya and Bogovarova, 1955)
$\text{Ni}_2\text{S}_3 + \text{FeS}$	(Kushima and Asano, 1953)
$\text{NiS} + \text{FeS}$	(Schenck and von der Forst, 1942)
$\text{NiS} + \text{FeS} + \text{CoS}$	(Anisheva and Kusakin, 1958)

NICKEL SULFATE  $\text{NiSO}_4$ 

SO

## SOLUBILITY IN WATER

The various data for this system are in only fair agreement. All authors agree on the nature of the phases and on the transition temperatures, but the reported solubilities differ by 1-3%. From the eutectic to 31° the stable phase is the green 7-hydrate; between 31° and 52° it is the blue 6-hydrate and above 52°, the green 6-hydrate. In addition, Rohmer found 5-, 4-, 3-, 2-, and 1-hydrates at high temperatures, mostly metastable.

The table below gives the most probable value for the solubility of the stable phases, based principally on the values of Tantzov (1924, 1925), Vilbrant and Bender (1923), and Rohmer (1939). The original values are tabulated in the table following.

t°	Gms. $\text{NiSO}_4$ per 100 Gms. $\text{H}_2\text{O}$	Solid Phase	t°	Gms. $\text{NiSO}_4$ per 100 Gms. $\text{H}_2\text{O}$	Solid Phase

## SOLUBILITY OF NICKEL SULFATE IN AQUEOUS SOLUTIONS OF METHYL ALCOHOL AT 14° (de Bruyn, 1903)

Small test tubes of 4-6 cc. capacity were used. They were almost completely filled with the salt and solvent and placed in the bath in an inclined position with salt occupying the upper part of the tube. This caused a "spontaneous circulation of the solvent." The solutions were analyzed by precipitating NiO with KOH at the boiling point, in porcelain vessels.

Wt. % CH <sub>3</sub> OH in Solvent	Gms. NiSO <sub>4</sub> per 100 Gms. Sat. Sol. in Contact with:			
	NiSO <sub>4</sub> ·7H <sub>2</sub> O as Solid Phase	NiSO <sub>4</sub> ·6H <sub>2</sub> Oα as Solid Phase	NiSO <sub>4</sub> ·6H <sub>2</sub> Oβ as Solid Phase	NiSO <sub>4</sub> ·4H <sub>2</sub> O as Solid Phase

## NICKEL SILICATES

SiO

A discussion of hydrothermal studies in the system  $\text{NiO} - \text{SiO}_2 - \text{H}_2\text{O}$  is given by Franzen and Van Eyk Van Voorthuijsen, 1950.

## NEPTUNIUM Hp

NEPTUNIUM NITRATES  $\text{Np}(\text{NO}_3)_4$ ,  $\text{NpO}_2(\text{NO}_3)_2$ 

NO

Data for the distribution of  $\text{Np}(\text{NO}_3)_4$  and  $\text{NpO}_2(\text{NO}_3)_2$  concentrations between aqueous  $\text{HNO}_3$  and tributyl phosphate are given by Alcock, Best Hesford and McKay, 1958 and by Healy and McKay, 1956.

Distribution of  $\text{Np}^{\text{IV}}$ ,  $\text{Np}^{\text{V}}$ , and  $\text{Np}^{\text{VI}}$  between 1 - 9 N aqueous  $\text{HNO}_3$  and dibutyl carbitol, ether, and methyl-i-butyl-ketone are reported by Kooi, 1956.

## NEPTUNIUM OXIDE

O

## HYDROXIDES

OH

Results of LaChapelle, Magnusson and Hindman, 1949

$\text{NpO}_2$  (peroxide) ppts. from 0.8 M  $\text{HNO}_3$  + 3 M  $\text{H}_2\text{O}_2$ . Solubility is 0.10 g. Np per liter

$\text{Np}(\text{OH})_4$  soly. in 0.5 M  $(\text{NH}_4)_2\text{SO}_4$  sat'd. with  $\text{NH}_3$  is 0.0029 g. Np per liter

$\text{Np}(\text{OH})_5$  soly. in 0.5 M  $(\text{NH}_4)_2\text{SO}_4$  sat'd. with  $\text{NH}_3$  is 0.78 g. Np per liter

$\text{Np}(\text{OH})_6$  soly. in 0.5 M  $(\text{NH}_4)_2\text{SO}_4$  sat'd. with  $\text{NH}_3$  is 0.27 g. Np per liter

NEPTUNIUM PHOSPHATE  $\text{Np}_3(\text{PO}_4)_4$ 

PO

The solubility in 0.9 M  $\text{HNO}_3$  + 0.1 M  $\text{H}_3\text{PO}_4$  is 0.1 g. Np per liter. (LaChapelle, Magnusson and Hindman, 1949.)

## 0 OXYGEN

### OXYGEN O<sub>2</sub>

#### SOLUBILITY OF OXYGEN IN WATER

Some early determinations give slightly high values at lower temperatures (see Bohr and Bock, below). Recent determinations indicate that the lower values are probably correct (Morrison and Billet, also table following)

$\beta$  = ml O<sub>2</sub> (at S.T.P.) absorbed by 1 ml H<sub>2</sub>O at a pressure of O<sub>2</sub> of 1 atm.

#### SOLUBILITY OF OXYGEN IN WATER IN CONTACT WITH AIR

These results, of considerable commercial and biological importance have been measured directly and calculated from data on pure oxygen. Morgan and Richardson, 1930 found that the values obtained in these two ways are the same. Extensive data upon the rate of solution of atmospheric oxygen and nitrogen in water are given in a series of papers by Adeney and Becker 1916-1920, 1919, 1920 and 1921.

Recent data again tend toward lower solubility values (see also table above). The following table was compiled by Truesdale, Downing and Lowden, 1955 for comparison of the various results these authors found the solubility at one atmosphere pressure (air and water vapor) to be:  $C = 14.161 - 0.3943t + 0.007714t^2 - 0.0000646t^3$  where C is the concentration of oxygen in water in parts per million, and t is °C.

500	0.41	0.82	1.11	1.40	2.00
600	0.78	1.48	2.27	3.03	3.81

Results for the solubility of O<sub>2</sub> in water at 1000, 1500, and 2000 p.s.i. from 32° to 625° F. are reported by Zoss, Suciu and Sibbitt. In agreement with the data above, minimum solubility occurs at about 233°F.

SOLUBILITY OF OXYGEN IN AQUEOUS SOLUTIONS OF ACIDS AND BASES

Results in terms of the Ostwald Coefficient  $\ell$  which shows the ratio of the volume (v) of gas absorbed at any pressure and temperature, to the volume (V) of the absorbing liquid.  $\beta$  is the Bunsen absorption coefficient in which the volume of gas is corrected to S.T.P.

## SOLUBILITY OF OXYGEN IN SEA WATER (Fox, 1909a)

Before using the sample of sea water for the solubility determinations, it was found necessary to add acid, otherwise the CO<sub>2</sub> could not be boiled out or the precipitation of neutral carbonates prevented. The very small amount of acid was titrated back, using phenolphthaleine as indicator.

Results in terms of cc. of oxygen absorbed by 1000 cc. of sea water from a free dry atmosphere at 760 mm. pressure.

The calculated formula expressing the solubility is:  $1000 a = 10.291 - 0.2809 t + 0.006009 t^2 - 0.0000632 t^3 - C1 (0.1161 - 0.003922 t + 0.0000631 t^2)$ .

Parts Chlorine per 1000	0°	4°	8°	12°	16°	20°	24°	28°
0	10.29	9.26	8.40	7.68	7.08	6.57	6.14	5.75
4	9.83	8.85	8.04	7.36	6.80	6.33	5.91	5.53
8	9.36	8.45	7.68	7.04	6.52	6.07	5.67	5.31
12	8.90	8.04	7.33	6.74	6.24	5.82	5.44	5.08
16	8.43	7.64	6.97	6.43	5.96	5.56	5.20	4.86
20	7.97	7.23	6.62	6.11	5.69	5.31	4.95	4.62

A recalculation of Fox's determinations to parts per million, with correction for vapor pressure, is published by Whipple and Whipple (1911).

More recent determinations of the solubility in saline water are reported by Truesdale, Downing and Lowden, 1955 between 0 and 40°. Extensive tables are given, and the results are somewhat lower than the older data of Fox, above.

SOLUBILITY OF OXYGEN IN BLOOD AT 38°

(Sendroy, Dillon and Van Slyke, 1934)

The authors point out that the earlier results reported by Bohr (1905) were not directly determined but estimated on the assumption that since his experiments showed hydrogen to be only 92 percent as soluble in blood as in water, oxygen would also have the same "relative solubility". The authors, have therefore, made direct determinations of the solubility of oxygen in blood and also determined the effect of its various constituents upon this solubility. The Van Slyke-Neil (1924) manometric gas apparatus was used (see preceding remarks in connection with results for the solubility of oxygen in water by Orcutt and SeEVERS). The results are given in terms of the Bunsen Abs. Coefficient defined on p. 1228

# 0 OXYGEN

## SOLUBILITY OF OXYGEN IN BLOOD AT 38°--Cont.

Solvent	Oxygen Abs. Coef. $\beta$
Water	0.02323
Aq. 0.155 normal NaCl	0.02211
Plasma	0.0209
Cells	0.0261
Whole Blood of normal hemoglobin content	0.0230 (0.034 at 20°)
Hemoglobin	0.0280*

\*This result shows the cc. O<sub>2</sub> taken up by 1 gm. of dissolved hemoglobin when the gas tension is 760 mm.

Data for the solubility of oxygen in hemoglobin are given by Jolin (1889).

Data for the solubility of oxygen in defibrinated ox-blood and ox-serum, at pressures varying from 760 to about 1400 mm. Hg, are given by Findlay and Creighton (1911).

## SOLUBILITY OF OXYGEN IN ORGANIC SOLVENTS

The data in the following two tables are in agreement and are generally somewhat higher than the values reported by earlier investigators.

### Results of Horiuti, 1931, 1932

SOLUBILITY OF OXYGEN IN VARIOUS SOLVENTS AT 25° AT HIGH PRESSURES  
(Frolich, Tauch, Hogan and Peer, 1931)

The determinations were made by shaking the solvent and oxygen together at various pressures in a 2 liter steel cylinder at 25° and after attainment of equilibrium withdrawing a sample of the saturated solution over mercury in one of three burets, so designed that the volumes could be measured with the same degree of accuracy at any ratio of gas to liquid. The results show that if the gas does not form a chemical compound with the solvent it follows Henry's Law over a wide pressure range within the limits of error allowed in engineering calculations. The solubility may for practical purposes be considered a linear function of the absolute pressure. In the case of the following results for oxygen,  $y$  is the volume of  $O_2$  at 25° and 1 atmosphere per unit volume of liquid, and  $x$  is the absolute pressure in atmospheres.

	Pressure Range in atmospheres	Solubility Equation
Water	0 - 70	$y = 0.028x$
Formic Acid	0 - 70	$y = 0.047x$
Carbon Tetrachloride	0 - 70	$y = 0.031x$
Pentane	0 - 100	$y = 0.576x$
Gas Oil (d. = 0.8319)	0 - 70	$y = 0.154x$

INFLUENCE OF ANESTHETICS UPON THE SOLUBILITY OF OXYGEN IN OLIVE OIL  
(Hamberger, 1911)

Name and Concentration of Narcotic added to the Oil		Solubility of Oxygen in:

## 0 OXYGEN

### SOLUBILITY OF OXYGEN IN RUBBER (Carpenter, 1947)

The rubber contained 100 parts of smoked sheet rubber by weight, 2.5 parts sulfur, 3.0 parts ZnO, 1.0 parts stearic acid, 0.5 parts each of mercaptobenzthiazole and agrite white. The adsorption was carried out in the dark on a cylindrical piece of the vulcanized product, and diffusion rates were also measured.

t°	Gms. N <sub>2</sub> per cc. Rubber per atm.	cc. N <sub>2</sub> (0°, 760 mm.) per 100 cc. Rubber per atm.

The solubility of oxygen and other gases in Metals has been extensively studied. A very complete bibliography of this work and of gas solubility is general is given in Landolt and Bornstein "Tabellen", 5th edition, 3rd supplement, first part, 1935.

For data on the solubility of oxygen in Nb see Braver, 1941; in liquid Bi see Griffith and Mallett, 1953; in Pt, Pd, Ni, Fe, Mn, and Si see Himmler, 1950; in Fe containing Al, Si or Mn see Hilty and Crafts, 1950; in  $\alpha$ -Fe, see Seybolt, 1954; in Pb see McMaster, 1952 and also Sano and Minowa, 1953; in Fe + FeO with SiO<sub>2</sub> present, see Derge, 1949.

Liquid - liquid and liquid - vapor equilibria in the system oxygen - ozone are reported by Schumacher, 1953, 1953a; Jenkins and Birdsall, 1954; Jenkins, DiPaolo and Birdsall, 1955; Brown, Berger and Hersh, 1955.

O<sub>3</sub> OZONE

## SOLUBILITY IN WATER

The solubility has been investigated many times, with only approximate agreement among the various results. Rawson (1953) reviews the data up to that time. It seems certain that some dissociation occurs, and that some of the discrepancies have been caused by reducing impurities. Rawson reports the rate of approach to saturation and took considerable care in the determinations; still, he reports finding occasional values that were different from the averages, far beyond the limits of experimental error. All observers agree that ozone obeys Henry's law.

## O<sub>3</sub> OZONE

### SOLUBILITY IN WATER--Cont.

Results are in terms of the Ostwald coefficient, which is the ratio of the concentration of gas in the vapor phase to that in the solvent. Also called the solubility ratio.

Data for the solubility of phosphorus in several slightly polar solvents is given by Negisi, 1940.

RED PHOSPHORUS is completely insoluble in turpentine even up to 270° provided the determination is made without access of air (sealed tube). If air is not excluded a portion of the red phosphorus may be converted to yellow phosphorus which would dissolve. (Colson, 1907.)

RECIPROCAL SOLUBILITY OF PHOSPHORUS AND SULFUR, DETERMINED BY THE  
SYNTHETIC (SEALED TUBE) METHOD  
(Giran, 1906)

(Mixtures of P and S were sealed in small tubes and first heated to about 200° to cause combination. They were then cooled to the solidification point and gradually heated to the temperature at which the last crystal disappeared. The following results, which were read from the diagram, show the eutectics and maxima of the curves.)

## P PHOSPHORUS

### PHOSPHOMOLYBDIC ACID $\text{H}_3\text{PO}_4 \cdot 12\text{MoO}_3 \cdot n\text{H}_2\text{O}$

Souchay, 1945 studied the systems phosphomolybdic acid - ether - water and phosphomolybdic acid - sulfuric acid - ether - water at 23.8° and found  $\text{H}_3\text{PO}_4 \cdot 12\text{MoO}_3 \cdot 30\text{H}_2\text{O}$  to be the stable phase in water solution at this temperature. The saturated solution contains 52 wt. %  $\text{H}_3\text{PO}_4 \cdot 12\text{MoO}_3$ . In solutions containing 24 - 33 wt. %  $(\text{C}_2\text{H}_5)_2\text{O}$ ,  $\text{H}_3\text{PO}_4 \cdot 12\text{MoO}_3 \cdot 14\text{H}_2\text{O}$  is the stable phase.

Data for the formula  $\text{P}_2\text{O}_5 \cdot 20\text{MoO}_3 \cdot 5\text{H}_2\text{O}$ :

Melting points for the system P + S are given by Illarionov and Sokolova, 1952.

### PHOSPHORUS SELENIDE $\text{P}_4\text{Se}_3$

100 cc. carbon disulfide dissolve 7.1 gm.  $\text{P}_4\text{Se}_3$  at about 20°. (Mai, 1928.)

## PROTOACTINIUM HALIDES and NITRATE

The extraction of Pa from HBr and HCl solutions by diisobutyl ketone and diisopropyl ketone and of the nitrate by americium acetate was studied by Goble, Golden and Maddock, 1956.

## PROTOACTINIUM HYDROXIDE

The solubility of the hydroxide in aqueous  $\text{HNO}_3$ ,  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{HClO}_4$  and  $\text{HF}$  is reported by Thompson, 1952.

## LEAD

Pb

## SOLUBILITY IN WATER AND AQUEOUS SOLUTIONS

Pariaud and Archinard, 1952 used electrolytically pure metals which had been degassed and freed of fines. The water was distilled 3 times, neutral and degassed. They report an equilibrium solubility of 310  $\gamma$  per liter at  $24^\circ$ .

An extensive investigation of the solubility of lead in the water passing through lead pipes is described by Paul, Ohlmuller, Heise and Auerbach, 1906. The solubility is increased by oxygen,  $\text{CO}_2$ , sulfates and perhaps other salts; it is decreased by hydrocarbonates.

Other experiments upon this subject are described by Zink, 1933. Lead of 98.24 percent purity was subjected to the action water free from and containing  $\text{CO}_2$  and various salts for periods of 24 hours. The bearing of these results upon the use of lead pipes as conductors for water supplies is discussed. Since the constituents of water passing through lead pipes form compounds which coat the interior of the pipes, the author gives the following values for the solubility of some of these products.

Compound		Mgs. Pb dissolved per liter	
Lead Oxide	$\text{PbO}$	63.8	
Lead Hydroxide	$3\text{PbO} \cdot \text{H}_2\text{O}$	93.3	
Lead Carbonate	(observed)	1.75	
Lead Carbonate	(calculated)	0.04	
$\frac{1}{2}$ basic "	(observed)	1.3	
$\text{PbO} \cdot 2\text{PbCO}_3 \cdot \text{H}_2\text{O}$	(calculated)	less than	0.04
Lead Sulfate	$\text{PbSO}_4$	26.0	
$\frac{1}{2}$ basic "	$\text{PbO} \cdot \text{PbSO}_4$	10.6	
$\frac{1}{4}$ " "	$3\text{PbO} \cdot \text{PbSO}_4 \cdot \text{H}_2\text{O}$	22.0	
Lead Chloride	$\text{PbCl}_2$	696.0	
$\frac{1}{2}$ basic "	$\text{PbO} \cdot \text{PbCl}_2 \cdot \text{H}_2\text{O}$	79.0	
$\frac{1}{4}$ " "	$3\text{PbO} \cdot \text{PbCl}_2 \cdot \text{H}_2\text{O}$	21.0	
Lead Nitrate	$\text{Pb}(\text{NO}_3)_2$	516.0	

The solubilities of various porcelain glazes containing lead in vinegar and citric acid solutions with varying conditions of exposure was determined by Geller and Creamer, 1939.

Studies on the corrosion of lead by sulfuric and nitrosylsulfuric acids were made by Adaduroff and Bauman, 1935.

# Pb LEAD

## SOLUBILITY OF LEAD IN MERCURY (Thompson, 1935)

A special apparatus and technique was necessary to avoid the oxidation which rapidly occurs in lead amalgams.

t°	Gm. Atom % Pb in sat. sol.	t°	Gm. Atom % Pb in sat. sol.
20	1.476	50	2.742
30	1.780	60	3.419

Results are given for the following systems:

Pb + PbCl <sub>2</sub>	(Urazov and Karnaukhov, 1954)(Karpachev, Stromberg and Jordan, 1942; 700°)(Corbett and Von Winbush, 1955; 600-800°)
Pb + PbS	(Esin and Sryvalin, 1951)
Pb + PbO	(Gebhardt and Obrowski, 1954)
Pb + SnCl <sub>2</sub> = Sn + PbCl <sub>2</sub> at 600°	(Körber and Oelson, 1932)
at 550°	(Jander and Striebich, 1937)
at 500°, 600°	(Lorenz and Schulz, 1928b)
Pb + SnBr <sub>2</sub> = Sn + PbBr <sub>2</sub> at 400°	(Lorenz and Schulz, 1928a)
Pb + 2TlCl = 2Tl + PbCl <sub>2</sub> at 500°	(Lorenz and Schmitt, 1930)
Pb + ZnCl <sub>2</sub> = Zn + PbCl <sub>2</sub> at 580°	(Jellinek and Siewers, 1932)
	(Urazov and Sokolova, 1944)
2Pb + Ag <sub>4</sub> P <sub>2</sub> O <sub>7</sub> = Ag + Pb <sub>2</sub> P <sub>2</sub> O <sub>7</sub> at 1200°	(Jellinek and Siewers, 1932)
Pb + SnS = Sn + PbS at 910°	(Anderson and Ridge, 1932)(Vogel and Zastera, 1950)
Pb + 2AgCl = PbCl <sub>2</sub> + 2Ag	(Urazov and Karnaukhov, 1956)

## LEAD ARSENITE Pb<sub>3</sub>(AsO<sub>3</sub>)<sub>2</sub>

AsO

## THE SYSTEM PbO - As<sub>2</sub>O<sub>3</sub> - H<sub>2</sub>O AT 25° (Story and Anderson, 1924)

Data are given for the composition (As<sub>2</sub>O<sub>3</sub> : PbO mole ratio) of the solid phase in equilibrium with various concentrations of As<sub>2</sub>O<sub>3</sub> in solution, but the PbO concentration in the liquid is not reported.

Gms. As <sub>2</sub> O <sub>3</sub> per 100 ml. solution:	< 0.05	Solid Phase:	Pb(OH) <sub>2</sub>
	0.05 - 2.20		Pb(AsO <sub>2</sub> ) <sub>2</sub>
	> 2.20		As <sub>2</sub> O <sub>3</sub>

The solubility of lead arsenite in dilute  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$  and  $\text{HCl}$  solutions (pH 2 - 3) at  $20^\circ$  is reported by Chukhlantsev, 1957.

LEAD ARSENATE  $\text{PbHAsO}_4$ 

AsO

THE SYSTEM LEAD OXIDE - ARSENIC PENTOXIDE - WATER AT  $25^\circ$ 

(Acid Region)

(Tartar, Rice and Sweo, 1931)

The results show that the lead arsenates are very insoluble. Qualitative tests of the liquid phase for the precipitation of lead as sulfate, chromate and sulfide gave negative results. It is suggested that precipitation as dilead arsenate can be used as a quantitative method for the determination of lead.

d. of sat. sol.	Gms. $\text{As}_2\text{O}_5$ per 100 gms. sat. sol.	Solid Phase	d. of sat. sol.	Gms. $\text{As}_2\text{O}_5$ per 100 gms. sat. sol.	Solid Phase
1.031	2.10	$\text{PbHAsO}_4$	1.732	54.56	$\text{PbHAsO}_4$
1.113	13.40	"	1.894	61.35	" + $\text{Pb}(\text{H}_2\text{AsO}_4)_2$
1.219	23.50	"	2.032	65.90	$\text{Pb}(\text{H}_2\text{AsO}_4)_2$
1.476	42.61	"	2.201	70.70	"
1.232	54.56	"	-	71.4	" + $\text{H}_3\text{AsO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$

Two gm. portions of amorphous dilead arsenate were agitated at  $32^\circ$  with 90 to 180 cc. portions of 0.0338 normal aqueous ammonia for two days. The saturated solutions were found to contain only traces of lead but amounts of  $\text{As}_2\text{O}_5$  varying from 1.956 to 1.429 gms. per liter. (McDonnell and Smith, 1916.)

Chukhlantsev, 1956 gives the Ksp of lead arsenate, as determined in dilute  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$  and  $\text{HCl}$  at  $20^\circ$ , as  $4 \times 10^{-36}$ .

The solubility of  $\text{PbHAsO}_4$  in water was estimated to be 2.55 mg./l. by polarographic reduction of Pb at the cathode, and 1.3 mg./l. by reduction of As at the cathode. However, the sample used probably contained  $\text{PbH}_4(\text{AsO}_4)_2$ .

SOLUBILITY OF COMMERCIAL LEAD ARSENATE IN AQUEOUS SOLUTIONS OF SALTS  
(Stewart, 1922)

The sample of commercial lead arsenate was guaranteed to contain not less than 25 per cent of arsenic and not more than  $1\frac{1}{2}$  per cent water soluble arsenic. The aqueous solutions containing an excess of the lead arsenate were shaken two or more times daily for three weeks or more at room temperature. One liter of each sat. solution was treated with 10 cc. of  $\text{HNO}_3$  + 10 cc. of  $\text{H}_2\text{SO}_4$  and evaporated to appearance of white fumes. The arsenic in the residue was determined by the modified Williamson method. Two concentrations of salt solutions were used, namely 0.01447 normal and 0.0723 normal. The solubility of the lead arsenate in distilled water was found to be 3.0 parts arsenic per million. In tap-water containing 212 parts of solids per million (mostly Ca and Mg bicarbonates) it was 33.8 parts arsenic per million.

## Pb LEAD

Each result in the tables represents an average of 2 to 10 determinations. Data are also given for the solubility of lead arsenate in soil solutions.

### RESULTS FOR THE SOLUBILITY OF LEAD ARSENATE IN 0.01447 NORMAL SALT SOLUTIONS

The solubility of commercial lead hydrogen arsenate, containing 64.2% PbO and 32.54% As<sub>2</sub>O<sub>3</sub>, in aqueous solutions of acids and salts and their combinations was studied by Robinson, 1929, for the purpose of finding the best solvent for use in removing arsenical spray residues from fruit under commercial conditions. It was found that acids dissolve the maximum amount of arsenate in 5 minutes with no increase up to 30 minutes. Most of the dilute salt solutions dissolved only a trace of the arsenical. When 0.25 percent Na<sub>2</sub>SO<sub>4</sub> was combined with 0.1 percent HCl the solubility was increased to more than 5 times that for HCl alone. This combination was found to be the most effective.

The solubility of PbHAsO<sub>4</sub> in various body fluids was determined by Fairhall, 1939.

## 80 LEAD BORATE Pb(BO<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>O

100 cc. anhydrous hydrazine dissolve about 2 gms. Pb(BO<sub>2</sub>)<sub>2</sub> at room temperature. (Welsh and Broderson, 1915.)

## 8r LEAD SUB BROMIDE PbBr

1000 cc. sat. solution of lead subbromide in water contain 0.4 milliequivalents PbBr at 25°, as determined by the conductivity method. (Denham, 1918.)

LEAD BROMIDE  $\text{PbBr}_2$ 

Br

100 gms. liquid sulfur dioxide (SO<sub>2</sub>) dissolve 0.012 gm. PbBr<sub>2</sub> at 0°. (Jander and Ruppolt, 1937.)

## Pb LEAD

Melting point data are given for the following systems:

$\text{PbBr}_2 + \text{PbI}_2$	(Delgery, 1946; Monkemeyer, 1906)
$\text{PbBr}_2 + \text{PbCl}_2$	(Delgery, 1946; Favorskii, 1940; Monkemeyer, 1906; Calingaert, Lamb, and Meyer, 1949)
$\text{PbBr}_2 + \text{AgBr}$	(Tubaudt and Eggert, 1920)
$\text{PbBr}_2 + \text{PbF}_2$	(Sandonnini, 1911)
$\text{PbBr}_2 + \text{PbO}$	(Sandonnini, 1914; Baroni, 1934; Knowles, 1950, 1951; Lamb and Niebylski, 1953)
$\text{PbBr}_2 + \text{CdCl}_2 \rightleftharpoons \text{PbCl}_2 + \text{CdBr}_2$	(Il'yasov, Rozhkovskaya and Bergman, 1957)

## Br BASIC LEAD BROMIDES

The  $K_{sp}$  of  $\text{PbBr}_2 \cdot \text{Pb}(\text{OH})_2$  is  $2 \times 10^{-15}$ , of  $\text{PbBr}_2 \cdot 3\text{Pb}(\text{OH})_2$  is about  $10^{-17}$  at room temperature. (Charreton, 1951.)

LEAD DICYCLOHEXYL DIBROMIDE  $(\text{C}_6\text{H}_{11})_2\text{PbBr}_2$

LEAD DICYCLOHEXYL DICHLORIDE  $(\text{C}_6\text{H}_{11})_2\text{PbCl}_2$

100 gms.  $\text{H}_2\text{O}$  dissolve 8.4 gm.  $\text{PbCH}_2\text{O}_6\text{S}_2$  at 25°. (Backer and Terpstra, 1929.)

**LEAD ACETATE (OUS)  $\text{Pb}(\text{CH}_3\text{COO})_2$**

SOLUBILITY OF LEAD ACETATE IN WATER  
(Dundon and Henderson, 1922)

The analysis of the saturated solutions was made by a method of "floating equilibrium". To a known weight of saturated solution of unknown concentration, water was added until the mixture attained the same density as a glass float calibrated at a definite arbitrary temperature. The saturated solutions were prepared by constant stirring in a thermostat and approaching equilibrium from 0.5° to 3.0° above the temperature desired. The solid was  $\text{Pb}(\text{CH}_3\text{COO})_2 \cdot 3\text{H}_2\text{O}$  in all cases.

Equilibrium was attained quickly in the acid solutions but 2-3 days were required in case of the basic salts. Both sat. solutions and solid phases were analyzed.

THE SYSTEM LEAD ACETATE - ACETIC ACID - WATER  
(Tarbuton and Vosburgh, 1932)

From 7 to 14 days were required for attainment of equilibrium depending upon the manner of preparing the solutions. The previous results of Sandved, 1927, are shown to be in error in certain respects.

0.10	34.72	46.35	69.42

THE SYSTEM LEAD ACETATE - LEAD OXIDE - WATER AT 25°  
(Jackson, 1914)

These results show the solubility of lead acetate in aqueous solutions containing increasing amounts of lead hydroxide. The mixtures were constantly agitated for periods varying from 2 to 7 days. Both the saturated solutions and the solid phases were analyzed. The basic lead in a given sample was determined by measuring the volume of standard acid neutralized by it. The neutral lead acetate was determined by precipitation of the lead as sulfate or as oxalate.

Experiments on the formation of basic lead acetates in aqueous ammonium hydroxide and sodium hydroxide solutions are described by Dubrisay and Saint Maxen, 1936. The temperature or method of securing saturation is not stated. The results are given only in the form of a diagram which shows that in each case the amount of lead in solution increases from about 20 to 34 percent as the concentration of alkali increases from 0 to 0.04 gm. mol. percent (?) and then very rapidly decreases as the concentrations of alkali increases to about 0.1 gm. mol. percent.

THE SYSTEM LEAD ACETATE - LEAD CHLORIDE - WATER AT 25°  
(Sandved, 1929)

The mixtures were prepared at 35° and after cooling to 25°, equilibrium was attained in 5 hours. The concentration of free acid in the solutions varied from 1.4 to 1.6 percent. The system is therefore strictly speaking not ternary but "pseudo ternary".

# **Pb LEAD**

Data for the solubility of lead citrate in sodium citrate solutions (0.02 - 1.4M) at 25° are given by Panova, 1957. The solubility of  $\text{Pb}_3(\text{C}_6\text{H}_5\text{O}_7)_2$  in water at 25° was found to be  $3.5 \times 10^{-5}$  moles/l.

## **LEAD salt (neutral) of racemic $\beta$ Methyl ADIPIC ACID**

100 gms. sat. solution in water contain 0.35 gm. of the salt at 20°. (Meurisse.)

## **CH LEAD GLUCONATE $\text{Pb}(\text{C}_6\text{H}_{11}\text{O}_7)_2$**

100 cc. sat. solution of lead gluconate in water contain 5.1 gms.  $\text{Pb}(\text{C}_6\text{H}_{11}\text{O}_7)_2$  at 25°. (May, Weisberg, and Herrick, 1929.)

## **LEAD BENZOATE $\text{Pb}(\text{C}_7\text{H}_5\text{O}_2)_2 \cdot \text{H}_2\text{O}$**

### **SOLUBILITY IN WATER** (Pajetta, 1906)

	18°	40.6°	49°
Gms. $\text{Pb}(\text{C}_7\text{H}_5\text{O}_2)_2$ per 100 gms. sat. sol.	0.149	0.249	0.310

### **SOLUBILITY OF LEAD BENZOATE IN WATER AND IN AQUEOUS SOLUTIONS AT 18°** (Auerbach and Weber, 1925)

	Gms. $\text{Pb}(\text{C}_6\text{H}_5\text{COO})_2$ per liter sat. sol.	Gms. $\text{Pb}(\text{C}_6\text{H}_5\text{COO})_2$ per liter sat. sol.
Water	1.647	16.70
Aq. 0.01n HCl	3.17	1892.0
Aq. 100 n $\text{CH}_3\text{COONa}$	14.18	
Aq. 1.0n $\text{CH}_3\text{COONH}_4$		
Aq. 50% $\text{C}_2\text{H}_5\text{OH}$		

The sat. sol. in water had pH = 6.0.

100 gms. methyl alcohol ( $\text{CH}_3\text{OH}$ ) dissolve 1.32 gms.  $\text{Pb}(\text{C}_6\text{H}_5\text{COO})_2$  at 15° and 2.65 gms. at 66° (b. pt.).

100 gms. acetone ( $(\text{CH}_3)_2\text{CO}$ ) dissolve 0.20 gms.  $\text{Pb}(\text{C}_6\text{H}_5\text{COO})_2$  at 15°. (Henstock, 1934.)

# LEAD Pb

## SOLUBILITY OF SEVERAL LEAD BENZOATES IN WATER AT 20° (Ephraim and Pfister, 1925)

		Gms. anhydrous cmpd. per 100 cc. sat. sol.
Lead Benzoate	$\text{Pb}(\text{C}_6\text{H}_5\text{COO})_2 \cdot \text{H}_2\text{O}$	0.179
Lead-4-Oxy benzoate	$\text{Pb}(\text{C}_6\text{H}_4\text{OH} \cdot \text{COO})_2 \cdot 2\text{H}_2\text{O}$	0.470
Lead-4-Nitro benzoate	$\text{Pb}(\text{C}_6\text{H}_4 \cdot \text{NO}_2 \cdot \text{COO})_2$	0.159
Lead-4-Chlor benzoate	$\text{Pb}(\text{C}_6\text{H}_4 \cdot \text{Cl} \cdot \text{COO}_2)_2 \cdot 2\text{H}_2\text{O}$	0.078
Lead-4-Methoxy benzoate	$\text{Pb}(\text{C}_6\text{H}_4 \cdot \text{OCH}_3 \cdot \text{COO})_2 \cdot \text{H}_2\text{O}$	0.0486

## LEAD TETRAPHENYL $\text{Pb}(\text{C}_6\text{H}_5)_4$

CH

Freezing-point data for  $\text{Pb}(\text{C}_6\text{H}_5)_4$  +  $\text{Si}(\text{C}_6\text{H}_5)_4$  are given by Pascal (1912).

## LEAD NITROSOPHENYL HYDROXYLAMINE (Cupferronate) $\text{Pb}[\text{C}_6\text{H}_5\text{N}(\text{NO}) \cdot \text{O}]_2$

One liter water dissolves 0.025 gm.  $\text{Pb}[\text{C}_6\text{H}_5\text{N}(\text{NO}) \cdot \text{O}]_2$  at 18°. (Pinkus and Martin, 1927.)

## TRICYCLOHEXYL LEAD $(\text{C}_6\text{H}_{11})_3\text{Pb}$

100 gms.  $\text{C}_2\text{H}_5\text{OH}$  dissolve 0.076 gm.  $(\text{C}_6\text{H}_{11})_3\text{Pb}$  at 30°. (Krause and Reiszhaus, 1921.)

100 gms.  $\text{C}_6\text{H}_6$  dissolve 2.28 gm.  $(\text{C}_6\text{H}_{11})_3\text{Pb}$  at 30°. (Krause and Reiszhaus, 1921.)

100 gms.  $\text{CHCl}_3$  dissolve 1.27 gm.  $(\text{C}_6\text{H}_{11})_3\text{Pb}$  at 30°. (Krause and Reiszhaus, 1921.)

## LEAD CINNAMATE $\text{Pb}(\text{C}_6\text{H}_5\text{CH}=\text{CHCOO})_2$

100 gms. sat. solution of lead cinnamate in water contain 0.141 gm.  $\text{Pb} \cdot \text{C}_{18}\text{H}_{14}\text{O}_4$  at 20°. (Ephraim and Pfister, 1925.)

Pb LEAD

LEAD QUINOLATES

## Pb LEAD

### LEAD 10-CAMPHOR SULFONATE $\text{Pb}(\text{C}_{10}\text{H}_{15}\text{OSO}_3)_2 \cdot 2\text{H}_2\text{O}$

The solubility of the salt in water is 78.25% at room temperature. (Pirrone, 1942.)

### RECIPROCAL SOLUBILITY OF LEAD NAPHTHALENE $\alpha$ AND $\beta$ MONOSULFONATES AT 24.5° (Euwes, 1909)

These results were used as the basis of a method for the analysis of unknown mixtures of  $\alpha$  and  $\beta$  naphthalene mono sulfonic acids. The unknown mixture was converted to the lead salt and its solubility compared with the above results.

CH	Gms. $\alpha$ salt added per 100 cc.	Gms. total $\alpha$ and $\beta$ salt found per 100 cc.	Gms. $\beta$ salt dissolved per 100 cc. sat. sol.

CH

LEAD 1,8-ANTHRAQUINONE SULFINATE,  $\text{PbC}_{14}\text{H}_6\text{O}_2(\text{SO}_2)_2\cdot\text{H}_2\text{O}$

At 20°, 650 gms.  $\text{H}_2\text{O}$  dissolve 1 gm. of the salt. At 100°, 275 gms.  $\text{H}_2\text{O}$  dissolve 1 gm. of the salt. (Kozlov and Smolin, 1949.)

LEAD HELIANTHATE  $\text{Pb}(\text{C}_{14}\text{H}_{14}\text{N}_3\text{SO}_3)_2\cdot 4\text{H}_2\text{O}$

1000 cc.  $\text{H}_2\text{O}$  dissolve 0.111 gm. lead helianthate (= 0.08 gm. helianthine) at 20°-25°. (Stark and Dehn, 1918.)

LEAD LIGNOCERATE

100 gms. anhydrous ether dissolve 0.025 gm. lead lignocerate at 25°. (Thomas and Yu, 1923.)

LEAD CAPROATE, CAPRYLATE, CAPRATE, NONYLATE, HEPTYLATE

SOLUBILITY OF EACH IN ETHER AND IN PETROLEUM ETHER  
(Neave, 1912)

The ethyl ether was distilled over sodium. Petroleum ether distilling between 40°-60° was used. The solutions were stirred constantly at 20°. A definite volume of the sat. solution was evaporated to dryness and residue weighed in each case.

LEAD Pb

LEAD OLEATE  $\text{Pb}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$ 

CH

100 gms. anhydrous ether dissolve 9.59 gms.  $\text{Pb}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$  at 25°. (Thomas and Yu, 1923.)

LEAD TETRAPHENYL  $\text{Pb}(\text{C}_6\text{H}_5)_4$ 

Data for the distribution of lead tetraphenyl between silicon and tin tetraphenyls are reported by Nefedov and Varshav, 1954.

LEAD CYANIDE  $\text{Pb}(\text{CN})_2$ 

CN

100 gms. liquid sulfur dioxide ( $\text{SO}_2$ ) dissolve 0.01 gm.  $\text{Pb}(\text{CN})_2$  at 0°. (Jander and Ruppolt, 1937.)

LEAD FERROCYANIDE  $\text{Pb}_2[\text{Fe}(\text{CN})_6]$ 

A saturated solution in water contains  $3.0 \times 10^{-5}$  gm. ions  $\text{Pb}^{++}$  per liter. (Tananaev, Glushokova and Seifer, 1956.)

The  $K_{sp}$  ( $-2\text{Pb}^{++} + \text{Fe}(\text{CN})_6^{--}$ ) at 20° is  $8.4 \times 10^{-17}$ . (Bovalini and Casini, 1953.)

## LEAD DOUBLE CYANIDES

SOLUBILITY IN WATER  
(Schuler, 1879)

Double Salt	Formula	t°	Gms. per 100 Gms. H <sub>2</sub> O
Lead Cobalticyanide	$\text{Pb}_3[\text{Co}(\text{CN})_6]_2 \cdot 7\text{H}_2\text{O}$	18	56.5
Lead Cobalticyanide	$\text{Pb}_3[\text{Co}(\text{CN})_6]_2 \cdot 7\text{H}_2\text{O}$	19	61.3
Lead Potassium Cobalticyanide	$\text{PbKCo}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$	18	14.8
Lead Cobalticyanide Nitrate	$\text{Pb}_3[\text{Co}(\text{CN})_6]_2 \cdot \text{Pb}(\text{NO}_3)_2 \cdot 12\text{H}_2\text{O}$	18	5.9
Lead Ferricyanide Nitrate	$\text{Pb}_3[\text{Fe}(\text{CN})_6]_2 \cdot \text{Pb}(\text{NO}_3)_2 \cdot 12\text{H}_2\text{O}$	16	7.5
Lead Potassium Ferricyanide	$\text{PbKFe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$	16	21.0

LEAD THIOCYANATE  $\text{Pb}(\text{SCN})_2$ 

SCN

One liter water dissolves 0.0137 gm. mol.  $\text{Pb}(\text{SCN})_2$  at 18°, as determined by E.M.F. measurements. (Masaki, 1931.)

## Pb LEAD

The Ksp of  $\text{Pb}(\text{SCN})_2$ , as determined in KSCN solutions at 25° is  $2.00 \times 10^{-5}$ . (Yatmirskii, 1951.)

100 gms. liquid sulfur dioxide ( $\text{SO}_2$ ) dissolve 0.012 gm.  $\text{Pb}(\text{SCN})_2$  at 0°. (Jander and Ruppolt, 1937.)

## CO LEAD CARBONATE $\text{PbCO}_3$

SOLUBILITY IN WATER BY ELECTRICAL CONDUCTIVITY METHOD  
(Kohlrausch and Rose, 1893; Böttger, 1903)

1 liter of water dissolves 0.0011 - 0.0017 gm.  $\text{PbCO}_3$  at 20°.

SOLUBILITY OF LEAD CARBONATE (NEUTRAL) IN AQUEOUS SOLUTIONS OF  
CARBON DIOXIDE AT 18°  
(Pleissner, 1907)

Millimols per Liter		Milligrams per Liter	
$\text{CO}_2$	$\text{PbCO}_3$	$\text{CO}_2$	$\text{PbCO}_3$
0	0.008	0	1.75
0.064	0.029	2.8	6
0.123	0.034	5.4	7
0.328	0.040	14.4	8.2
0.592	0.048	26	9.9
0.988	0.053	43.5	10.9
2.40	0.076	106	15.4

100 gms. of a sat. solution of lead carbonate in water at 18° and in contact with  $\text{CO}_2$  at a pressure of 1 atmosphere, contain 0.014 gm.  $\text{PbCO}_3$ . At a pressure of 56 atmospheres of  $\text{CO}_2$ , 0.015 gm.  $\text{PbCO}_3$  are dissolved. (Haehnel, 1924.)

SOLUBILITY OF LEAD CARBONATE AND OTHER LEAD SALTS IN BLOOD SERUM AT 25°  
(Fairhall, 1924a)

An excess of metallic lead or of the lead salt was added to 250 cc. bottles containing fresh horse serum preserved with a small amount of thymol. The bottles were rotated for 24 hours in a thermostat at 25°. The undissolved solid was thrown down by centrifugation and portions of the clear sat. solution were analyzed by evaporating, ashing, converting the lead to chromate and titrating with 0.005 N thiosulfate solution.

Lead compound employed	Gms. lead compd. per liter of Serum at 25°	Comparative solubility in Water		
Lead carbonate ( $\text{PbCO}_3$ )	0.0333 (0.0125)	0.0017	at 18°	(Pleissner)
Lead sulfate ( $\text{PbSO}_4$ )	0.0437 (0.0300)	0.044	at 24°.95	(Böttger)
Lead chromate $\text{PbCrO}_4$	-	0.00001	at 25°	(von Hevesy)
Lead oxide $\text{PbO}$	1.1520 (1.1600)	0.0171	at 20°	(Pleissner)
Lead Pb	0.578 (0.193)			

The results in parentheses were obtained by saturating the fresh serum suspensions of the solid with  $\text{CO}_2$  at 25°, and determining the

solubility as above. The high value for  $PbO$  is due to the formation of lead hydroxide, which is removed by protein, with which it combines to form an alkali metaprotein.

### LEAD CARBONATE (Basic) $Pb_3(CO_3)_2(OH)_2$

CO

Results for the solubility of basic lead carbonate and of lead oxides in aqueous potassium hydroxide solutions at  $25^\circ$  are given by Randall and Spencer, 1928. The change of the stoichiometrical equilibrium constant with concentration shows that the activity coefficient of the plumbite ion is about the same as that of the nitrate ion in dilute solutions. From the extrapolated values of the equilibrium constants, the free energies of the solutions have been calculated.

A determination of the solubility of basic lead carbonate in water gave 1.6 mg.  $Pb_3(CO_3)_2(OH)_2$  per liter = 1.3 mg. Pb or 0.006 millimol Pb. (Pleissner, 1907.)

Data for the solubility of basic lead carbonate in various salt solutions of very low concentration is given by Ruchoff and Kachmar, 1942.

### LEAD OXALATE $PbC_2O_4$

CO

One liter of water dissolves 0.0015 gm.  $PbC_2O_4$  at  $18^\circ$  (conductivity method). (Böttger, 1903; Kohlrausch, 1904-05.)

#### SOLUBILITY OF LEAD OXALATE IN OXALIC ACID AND POTASSIUM CHLORIDE SOLUTIONS AT $25^\circ$ (Kurashvili, 1939)

100 cc. anhydrous hydrazine dissolve 3 gms.  $PbCl_2$  at ord. temp. with decomposition. (Welsh and Broderick, 1915.)

100 gms. liquid sulfur dioxide ( $SO_2$ ) dissolve 0.019 gm.  $PbCl_2$  at  $0^\circ$ . (Jander and Ruppolt, 1937.)

Melting point data are given for:

$PbCl_2 + PbF_2$	(Sandonnini, 1911; Pelabon and Lande, 1928; Anosov and Patsukova, 1956)
$PbCl_2 + PbI_2$	(Monkemeyer, 1906; Pelabon and Lande, 1928; Sumarokova and Modestova, 1956; Delgrey, 1946)
$PbCl_2 + PbO$	(Ruer, 1906; Baroni, 1934; Pelabon and Lande, 1928)
$PbCl_2 + Pb_3(PO_4)_2$	(Amadori, 1918; 1919)
$PbCl_2 + Pb_3(VO_4)_2$	(Amadori, 1919)
$PbCl_2 + PbS$	(Truthe, 1912)
$PbCl_2 + AgCl$	(Tubaudt and Eggert, 1920)
$PbCl_2 + KCl$	(Tries, 1914; Lorenz and Ruckstuhl, 1906; Ugai and Shatillo, 1949)
$PbCl_2 + NaCl$	(Tries, 1914; Demassieux, 1923)
$PbCl_2 + RbCl$	(Tries, 1914)
$PbCl_2 + SrCl$	(Sandonnini, 1911, 1914)
$PbCl_2 + TiCl$	(Korring, 1911; Sandonnini, 1911, 1914)
$PbCl_2 + SnCl_2$	(Hermann, 1911; Sandonnini, 1911, 1914)
$PbCl_2 + ZnCl_2$	(Hermann, 1911; Ugai and Shatillo, 1949)
$PbCl_2 + Cd = Pb + CdCl_2$	(Elagina and Palkin, 1956)
$PbCl_2 + CdI_2 = PbI_2 + CdCl_2$	(Ilyasov and Bergman, 1957)
$PbCl_2 + ZnCl_2 + KCl$	(Ugai and Shatillo, 1949)

The solubility of  $PbCl_2$  in  $AgCl$  and  $AgCl + CdCl_2$  at  $270^\circ$  was determined by Wagner and Zimens, 1947, Wagner, 1956.

## LEAD TETRACHLORIDE $PbCl_4$

Cl

Melting points in the systems  $PbCl_4 + CCl_4$ ,  $PbCl_4 + SiCl_4$ ,  $PbCl_4 + TiCl_4$  and  $PbSO_4 + SnCl_4$  are given by Seckmann, 1955, 1957.

## LEAD FLUOROCHLORIDE $PbFCl$

### SOLUBILITY OF LEAD FLUOROCHLORIDE IN WATER AND IN AQUEOUS SOLUTIONS (Stark, 1911)

Solubility in Water      Solubility in Aqueous Solutions at  $25^\circ$

$t^\circ$	Gms. $PbFCl$ per 100 Gms. $H_2O$	Aqueous Solution of:	Gms. $PbFCl$ per 100 cc. Sat. Sol.

Pb LEAD

Cl LEAD CHLORIDE (Basic)

SOLUBILITY OF BASIC LEAD CHLORIDES IN WATER AT 18°  
(Pleissner, 1907)

Compound	Formula	Gms. per Liter Sat. Aq. Solution	
		Pb	= Pb Salt
$\frac{1}{2}$ Basic Lead Chloride	$\text{PbCl}_2 \cdot \text{PbO} \cdot \text{H}_2\text{O}$	0.079	0.099
$\frac{3}{4}$ Basic Lead Chloride	$\text{PbCl}_2 \cdot 3\text{PbO} \cdot \text{H}_2\text{O}$	0.021	0.025

Deschamps and Charreton, 1951 report the following solubility product constants:

$$[\text{Pb}^{++}] [\text{OH}^-]^2 = 3 \times 10^{-20}$$

$$[\text{Pb}^{++}] [\text{Cl}^-] [\text{OH}^-] = 1.7 - 9.7 \times 10^{-14}$$

$$[\text{Pb}^{++}] [\text{Cl}^-]^{1/2} [\text{OH}^-]^{5/2} = 10^{-17}$$

ClO LEAD CHLORITE  $\text{Pb}(\text{ClO}_2)_2$

SOLUBILITY OF LEAD CHLORITE IN WATER  
(Levi, 1923)

t°	Gms. $\text{Pb}(\text{ClO}_2)_2$ per 100 gms. sat. sol.	Solid Phase
0	0.035	$\text{Pb}(\text{ClO}_2)_2$
25	0.12	"
50	0.19	"
75	0.32	"
100	0.41	"

ClO LEAD CHLORATE  $\text{Pb}(\text{ClO}_3)_2 \cdot \text{H}_2\text{O}$

100 grams  $\text{H}_2\text{O}$  dissolve 151.3 gms.  $\text{Pb}(\text{ClO}_3)_2$ , or 100 gms. sat. solution contain 60.2 gms.  $\text{Pb}(\text{ClO}_3)_2$  at 18°. Density of solution, 1.947. (Mylius and Funk, 1897.)

100 gms.  $\text{H}_2\text{O}$  dissolve 440 gms.  $\text{Pb}(\text{ClO}_3)_2$  at 18°,  $d_{18} = 1.63$ . (Carlson, 1910.)

LEAD PERCHLORATE  $Pb(ClO_4)_2$ 

ClO

Solvent	t°	Solubility
Water	25	81.47 gms. $Pb(ClO_4)_2$ per 100 gms. sat. sol. ( $d_{25} = 2.7753$ ) (solid phase $Pb(ClO_4)_2 \cdot 3H_2O$ ) (Willard and Kassner, 1926)
Furfural	20	25 gms. $Pb(ClO_4)_2$ per 100 cc solvent (Chaney and Mann, 1931)
Cellosolve	20	105 gms. $Pb(ClO_4)_2$ per 100 cc solvent (Chaney and Mann, 1931)
Acetonitrile	25	10 gms. $Pb(ClO_4)_2$ per 100 gms. sat. sol. (Pleskov, 1948)

LEAD HEXA ANTIPYRINE PERCHLORATE  $[Pb(COC_{10}H_{12}N_2)_6](ClO_4)_2$ 

100 cc sat. solution of lead hexa antipyrine perchlorate in water contain 5.44 gms.  $[Pb(COC_{10}H_{12}N_2)_6](ClO_4)_2$  at 20°. (Wilke-Dörfurt and Schliephake, 1929.)

LEAD CHROMATE  $PbCrO_4$ 

CrO

## SOLUBILITY OF LEAD CHROMATE IN WATER

t°	Mols. $PbCrO_4$ per Liter	Gms. $PbCrO_4$ per Liter	Method	Authority
18	$3.0 \cdot 10^{-7}$	0.00010	Solution equilibrium	(Beck and Stegmüller, 1910)
--	$1.4 \cdot 10^{-7}$	0.00004	Solution equilibrium	(Auerbach and Pick)
18	$3.2 \cdot 10^{-7}$	0.00010	Conductivity	(Kohlrausch, 1908)
20	$2.1 \cdot 10^{-7}$	0.00007	Radio Indicators	(v. Hevesy and Rona, 1915)
20	$5.4 \times 10^{-7}$	0.00017	(pH of water 6.27)	(Huybrechts and Degard, 1933)
25	$5.3 \times 10^{-7}$	0.00017	(Kolthoff, Perlich and Weiblen, 1942)	

$1.27 \times 10^{-4}$  moles of  $PbCrO_4$  dissolve in one liter of 0.1 M  $HClO_4$ . (May and Kolthoff, 1948.) The authors found the solubility of freshly precipitated  $PbCrO_4$  to be considerably greater than that of aged samples, and measured the specific surface area of each type.

Pb LEAD

SOLUBILITY OF LEAD CHROMATE IN AQUEOUS SOLUTIONS OF PERCHLORIC ACID  
AND OF MIXTURES OF PERCHLORIC ACID AND LEAD PERCHLORATE AT 25°

0.6	46.60	61.06	97.20	0.6	12.39

Results are also given for the solubility of mixtures of lead chromate and lead sulfate in aqueous hydrochloric acid at 25° and 37°.

SOLUBILITY OF LEAD CHROMATE IN AQUEOUS SOLUTIONS OF NITRIC ACID AND  
OF MIXTURES OF NITRIC ACID AND LEAD NITRATE AT 25°  
(Willard and Kassner, 1926)

The solubility of lead chromate in perchloric acid increases up to a molar concentration of the acid of about 4.0 and then begins to decrease, while in nitric acid the solubility continues to increase with increasing concentration of acid. It is also noted that lead chromate is much less soluble in perchloric than in nitric acid of the same concentration.

SOLUBILITY OF LEAD CHROMATE IN AQUEOUS SOLUTIONS OF NITRIC ACID AND OF MIXTURES OF NITRIC ACID AND LEAD NITRATE AT 25°--Cont.

The solubility of lead chromate is greatly reduced in presence of soluble chromates. In aqueous 0.0001 normal K<sub>2</sub>CrO<sub>4</sub> only 0.00006 gms. PbCrO<sub>4</sub> per liter was present. Results are given showing the solubility of PbCrO<sub>4</sub> in aqueous solutions of mixtures of acetic acid and ammonium acetate and of the reduction of the solubility of PbCrO<sub>4</sub> in aqueous acetic acid, ammonium acetate and of their mixtures, caused by the simultaneous presence of calcium chromate. The application of these results to the titrametric determination of lead is discussed.

SOLUBILITY OF LEAD CHROMATE IN AQUEOUS POTASSIUM HYDROXIDE SOLUTIONS  
(Lacland and Lepierre, 1891)

t° Grams KOH per 100 cc. Grams PbCrO<sub>4</sub> per 100 cc.

15	2.308	1.19
60	2.308	1.62
86	2.308	2.61
102	2.308	3.85

Fusion point data for mixtures of lead chromate and lead sulfate, lead chromate and lead molybdate, and lead chromate and lead tungstate are given by Jaeger and Germs, 1921.

## Pb LEAD

### BASIC LEAD CHROMATE

Charreton, 1952 reports the solubility product  $[Pb^{++}]^2 [OH^-]^2 [CrO_4^{=}] = 2.1 \times 10^{-32}$  at room temperature.

## F LEAD FLUORIDE $PbF_2$

### SOLUBILITY IN WATER

t°

9	0.6 gms. per liter (conductivity method)	(Kohlrausch, 1908)
18	0.64 gms. per liter (conductivity method)	(Kohlrausch, 1908)
25	0.66 gms. per liter (pH of solution = 5.3)	(Carter, 1928)
26.6	0.68 gms. per liter	(Kohlrausch, 1908)

Experiments upon the influence of the size of grain upon the solubility of lead fluoride in water are given by Duncan, 1923.

Data for the solubility of  $PbF_2$  in  $AlF_3$  solutions at 25° are given by Scott, 1947.

Data for the solubility of  $PbF_2$  in 0.086 - 12.82 molar KF solutions, and in 0.059 - 0.89 molar NaF solutions at 25° are reported by Talipov and Kutumov, 1956.

### SOLUBILITY OF LEAD FLUORIDE IN AQUEOUS SALT SOLUTIONS AT 18° - 20° (Golovatyj, 1940)

KF (N)	Millimoles $PbF_2$ per liter

25	0.0307 gms. $Pb(IO_3)_2$ per liter	(Harkins and Winninghoff, 1911)
	0.0201 gms. $Pb(IO_3)_2$ per liter	(LaMer and Goldman, 1930)
	See also Keefer and Reiber, below	
25.8	0.023 gms. $Pb(IO_3)_2$ per liter	(Böttger, 1903)

### SOLUBILITY OF LEAD IODATE IN WATER AND AMINO ACID SOLUTIONS AT $25^\circ$ (Keefer and Reiber, 1941)

Two samples of lead iodate were prepared; one (I) by mixing  $Pb(NO_3)_2$  solution with  $KIO_3$  in a total volume of about 3 liters. The other (II) was prepared by the method of LaMer and Goldman (Vol. I, p. 1400) in which a much larger volume of water is used and no excess of  $K^+NO_3^-$  is allowed to accumulate. The solubility of the first sample in water was  $5.34 \times 10^{-5}$  moles per liter, in agreement with that found by Kohlrausch and by Harkins and Winninghoff (both above). The solubility of the second sample was identical with the similarly prepared sample of LaMer and Goldman:  $3.61 \times 10^{-5}$  L. and G. attributed this difference to the increased purity of their salt. The present authors feel that the difference in particle size explains the variation. Results given below are in moles per 1000 gms. of water.

SOLUBILITIES OF THE NITRATES OF LEAD ISOTOPES IN WATER AT 25°.02  
(Richards and Schumb, 1918)

The two samples of nitrate were prepared, one from salt made from "test lead" free from silver and tin, and the other from pure Australian uranio-lead nitrate. Saturation was approached from above and below the selected temperature, by constant rotation of a large excess of the solid with distilled water. Saturation was reached with extreme slowness. At least 24 hours were required. Weighed portions of the saturated solution were evaporated with  $\text{H}_2\text{SO}_4$  and the lead sulfate weighed after heating to constant weight at 350°.

Sample of Lead Nitrate from:	Gms. $\text{Pb}(\text{NO}_3)_2$ per 100 gms.	
	Sat. sol.	Water
Common Lead	37.342	59.597
Uranio Lead	37.280	59.439
Difference	0.062	0.158

An experiment similar to the above is reported by Fajans, Fischler and Lambert, 1916. These authors prepared very pure nitrate from ordinary commercial lead of at. wt. 207.15 and from lead prepared from Colorado carnotite, and having an at. wt. of 206.59. Saturation was approached from above and below by constant agitation for at least two days at 24°.43. Very accurate specific gravity determinations of the saturated solutions were also made. The determination of the lead was made as sulfate.

Sample of Lead Nitrate from:	$d_{24}^{45}$ of sat. sol.	$\text{PbSO}_4$ found in 3.0445 cc. of sat. sol.	Mol. Solubility
Ordinary Lead	$1.444499 \pm 0.000013$	1.4693	= 0.004855
Carnotite	$1.443587 \pm 0.000016$	1.4740	= 0.004861
Joachimsthaler Pechblend	$1.443586 \pm 0.0000015$		
		Difference	0.000006

The authors conclude from the density experiment that a difference exists in the sp. gr. of the saturated solutions of the nitrates of lead isotopes which is slightly greater than that calculated. The difference in the molecular solubility is less than 1%, while the difference in atomic weight is 2.7%.

100 gms. H<sub>2</sub>O sat. with Pb(NO<sub>3</sub>)<sub>2</sub> + NaNO<sub>3</sub> at 20° dissolve 38.42 gms.  
Pb(NO<sub>3</sub>)<sub>2</sub> + 84.59 gms. NaNO<sub>3</sub>. (LeBlanc and Noyes, 1890.)

Results at various temperatures

(Isaac, 1908)

(The several mixtures were enclosed in sealed tubes and heated until only one or two very small crystals remained undissolved. The temperature was then determined at which the edges of these crystals just showed a change from sharp to round or vice versa.)

4.	Yellow Oxide, by heating No. 2 to 740°	1.00 x 10 <sup>-4</sup>	0.022

(Cont.)

## SOLUBILITY IN WATER--Cont.

No.	Description of Oxide	Gm. Equiv. per Liter	Gms. per Liter
5.	Yellow Oxide, by heating com. yellow brown oxide to 620°	$1.09 \times 10^{-4}$	0.024
6.	Yellow Brown Oxide commercially pure	$1.10 \times 10^{-4}$	0.024
7.	Yellow Brown Oxide, by long rubbing of No. 5	$1.12 \times 10^{-4}$	0.025

Bottger gives for three samples of lead oxide, 0.017, 0.021, and 0.013 gm. per liter respectively.

One liter  $H_2O$  dissolves 0.068 gm.  $PbO$  at 18°, solid phase  $PbO$  and 0.1005 gm.  $PbO$  at 18°, solid phase  $Pb_2O_2(OH)_2$ . (Pleasner, 1907.)

0

SOLUBILITY OF LEAD OXIDE ( $PbO$ ) IN WATER  
(Remy and Kuhlmann, 1924; Remy, 1925)

Millimols. $PbO$ per liter at 18°	Milligrams. $PbO$ per liter at 20°	Method
0.055	12.34	Calc. from electrolytic conductivity.
0.055	12.39	Conducto titrametric determination of used amt. of acid for saturation

The SOLUBILITY PRODUCT of red lead monoxide in water at 25° is  $1.17 \times 10^{-15}$  and the solubility is  $0.26 \times 10^{-3}$  gm. mol. per liter (Glasstone, 1921). The author states that this rough comparison emphasizes the uncertainty of the ionization of lead monoxide in water and the futility of determining the solubility of lead monoxide or hydroxide in water by the conductivity method.

100 cc. anhydrous hydrazine dissolve 1 gm. lead oxide (red) at room temp. (Welsh and Brodersen, 1915.)

Data are given for the following systems:

$PbO + PbS$	(Kohlmeyer and Monzer, 1943)
$PbO + PbS + Pb$ at 1050°	(Kohlmeyer and Monzer, 1943)
$PbO + PbSO_4 + Pb$ at 1050°	(Kohlmeyer and Monzer, 1943)
$PbO + MoO_3$	(Jaeger and Germs, 1921)
$PbO + SO_3$	(Jaeger and Germs, 1921)
$PbO + WO_3$	(Jaeger and Germs, 1921)
$PbO + P_2O_5$	(Amadori, 1916-17)
$PbO + V_2O_5$	(Amadori, 1916-17)
$PbO + Pb_3(PO_4)_2$	(Amadori, 1914)
$PbO + Pb_3(VO_4)_2$	(Amadori, 1914)
$PbO + PbSO_4$	(Lander, 1949; Schenck and Albers, 1919; Schenck and Rossbach, 1908)
$PbO + SiO_2$	(Weiller, 1911; Cooper, Shaw and Loomis, 1909; Geller, Creamer and Bunting, 1934)
	(Shartis, Spinner, and Smock, 1948)
	(McMurdie and Bunting, 1939)
$PbO + B_2O_3$	(McMurdie, 1941; Shartis, Spinner, and Smock, 1948; Geller and Bunting, 1939)

# Pb LEAD

## OH LEAD HYDROXIDE $Pb(OH)_2$ or $PbO \cdot xH_2O$

Oka, 1940 reports the solubility of  $Pb(OH)_2$  in water to be  $4.8 \times 10^{-6}$  moles per liter.

Results for the solubility of hydrated lead oxide in water and dilute  $H_2SO_4$  solutions are given by Sehna1 (1909). The results are considerably higher than the above, viz. 0.1385 gm. Pb per 1000 cc.  $H_2O$  at  $20^\circ$ ; with increase of  $H_2SO_4$  the solubility decreases rapidly.

Data for the formation of lead hydroxide by hydrolysis of lead iodate and the solubility in perchloric acid solutions at  $35^\circ$  are reported by Pattanaik and Pani, 1957.

Korenman, Frum and Chebakova, 1952 report the Ksp of  $Pb(OH)_2$ , as determined by potentiometric titrations [ $NaOH$  vs.  $Pb(NO_3)_2$ ] to be  $1.1 \times 10^{-20}$  at  $22^\circ$ ,  $3.2 \times 10^{-20}$  at  $40^\circ$ , and  $3.5 \times 10^{-20}$  at  $60^\circ$ .

SOLUBILITY OF DIFFERENT FORMS OF LEAD HYDROXIDE IN AQUEOUS NORMAL  
SOLUTIONS OF SODIUM HYDROXIDE

Form of PbO used	Manner of attaining saturation	t°	Gm. mol. PbO per liter sat. sol.
------------------	-----------------------------------	----	-------------------------------------

Results of Glasstone, 1921:

Ordinary	Gentle shaking (14 days)	20	0.045 (aver of 8 det.)	
Ordinary	Vigorous shaking (14 days)	20	0.047	
Reddish-brown-yellow	Stirring gently with air bubbles	20	0.039	
Red	Stirring gently with air bubbles	20	0.035	OH

Results of Appleby and Reid, 1922

Yellow	Stirring gently with air bubbles	20	0.0237*
Red	Stirring gently with air bubbles	20	0.0140*

\*Mean values obtained after stirring with slow stream of air up to 5 months. According to Glasstone the differences are explainable on the grounds of the varying size of the particles. Appelby and Reid consider that the results indicate that the yellow and red forms are polymorphic modifications of lead monoxide.

SOLUBILITY OF LEAD HYDROXIDE IN AQUEOUS SOLUTIONS OF SODIUM HYDROXIDE

## Potassium Hydroxide

Normality of Aq. KOH	Gm. mols. $PbO \cdot xH_2O$ per liter sat. sol.
0.1177	0.00892
0.9985	0.0631

The above repetition of Herz, 1901, experiments fail to confirm his results. Pleissner's (1907) hydrated oxide was used.

Results similar to the above for the solubility of the several polymorphic forms of lead oxide in aqueous NaOH solutions up to 20 normal and at both 20° and 84° are given by Applebey and Powell, 1931. The black modification was shown to owe its color to metallic lead.

More recent very careful determinations of the solubility of lead oxides in water and in aqueous solutions of sodium hydroxide at 25°, are given by Garrett, Vellenger and Fontana, 1939. The numerous determinations as plotted by the authors show that most of those made with red lead oxide fall in one curve and the determinations made with yellow, white, and black lead oxide fall more or less close to another curve. The approximate values read from these curves are as follows.

Gm. Mols. per 1000 gms. $H_2O$			Gm. Mols. per 1000 gms. $H_2O$		
NaOH	Red PbO	yellow, white and black PbO	NaOH	Red PbO	yellow, white and black PbO

0.003	0.00017	0.00036	0.010	0.0005	0.00085

The data were used by the authors for various theoretical calculations.

Data for the equilibrium in the system lead oxide + lead hydroxide + plumbite + NaOH +  $H_2O$  are given by Erich Muller, 1924a.

## OH LEAD HYDROXIDE (ic) $Pb(OH)_4$

The solubility in water is  $2.6 \times 10^{-14}$  moles per liter (Oka, 1940).

The  $K_{sp}$  of  $Pb_3O_4$  in water at 20° is reported to be  $10^{-50.3}$  by Bovalini and Casini, 1953.

LEAD SESQUIOXIDE  $Pb_3O_4$ SOLUBILITY OF LEAD SEAQUIOXIDE ( $Pb_2O_3$ ) IN AQUEOUS SODIUM HYDROXIDE SOLUTIONS  
(Glasstone, 1922a)

Solution of plumbite, plumbate and dilute alkali or water were mixed in various proportions and kept 4 or 5 weeks at room temperature. The supernatant solution above the precipitated sesquioxide was removed and analyzed. Equilibrium was reached very slowly.

Gram mols. per liter sat. sol.

NaOH	Plumbite $\times 10^3$	Plumbate $\times 10^3$	$\frac{[HPbO_2^-][PbO_3^-]}{[OH^-]^3} \times 10^6$
1.20	8.75	0.412	2.09
1.26	12.12	0.35	2.08
1.79	1.60	11.50	3.20
2.41	20.0	1.20	1.72
2.63	21.5	2.65	3.12

LEAD PEROXIDE  $PbO_2$ 

0

The two forms of lead superoxide, (a) amorphous and (b) crystalline, differ in their solubilities in sulphuric acid. One liter of very concentrated  $H_2SO_4$  dissolves about 0.010 mol.  $PbO_2$  (b) at  $22^\circ$ . One liter of conc.  $H_2SO_4$  containing 1720 gms. per liter, dissolves 0.0995 mol.  $PbO_2$  (a) at  $22^\circ$ . The solid phase is slowly converted to  $Pb(SO_4)_2$ . One liter of  $H_2SO_4$  containing 1097 gms.  $H_2SO_4$  per liter dissolves 0.004 mol.  $PbO_2$  at  $22^\circ$ . The solid phase is converted more quickly to  $Pb(SO_4)_2$ . In more dilute  $H_2SO_4$  solutions no solubility can be detected. (Dolezalek and Finckli, 1906.)

LEAD PHOSPHATE (Ortho)  $Pb_3(PO_4)_2$ 

PO

One liter water dissolves 0.000135 gm. lead phosphate at  $20^\circ$  by conductivity method. (Böttger, 1903.)

One liter of 4.97 per cent aqueous acetic acid solutions dissolves 1.27 gms.  $Pb_2(PO_4)_2$ . (Bertrand, 1868.)

The Ksp at  $20^\circ$  is reported as  $1 \times 10^{-32}$  by Bovalini and Casini, 1953.

More recent studies of the solubility of lead phosphates in water, using electrometric methods, are described by Millett and Jowett, 1929, and Jowett and Price, 1932. Their earlier results were found to be in error. Their final determinations for primary lead phosphate,  $Pb_3(PO_4)_2$  secondary lead phosphate,  $PbHPO_4$ , and lead pyromorphite,  $Pb_3(PO_4)_3Cl$ , the stable salt in presence of chloride ion, have been used for calculating the solubility products of each compound.

## Pb LEAD

### PO LEAD PHOSPHATES, Primary, $\text{PbH}_4(\text{PO}_4)_2$ ; Secondary, $\text{PbHPO}_4$

EQUILIBRIUM IN THE SYSTEM LEAD OXIDE, PHOSPHORIC ANHYDRIDE AND WATER AT 25°  
(Fairhall, 1924)

The mixtures were rotated in a thermostat for several weeks, and the solutions analyzed from time to time until equilibrium was reached. The composition of the solid phases was determined by the Schreinemaker residue method.

$d_{25}^{25}$ of sat. sol.	Gms. per 100 cc.		Solid Phase	$d_{25}^{25}$ of sat. sol.	Gms. per 100 cc.		Solid Phase
	Sat.	Sol.			Sat.	Sol.	
	$\text{P}_2\text{O}_5$	PbO			$\text{P}_2\text{O}_5$	PbO	
1.036	5.273	0.138	$\text{PbHPO}_4$	1.302	45.335	1.175	$\text{PbHPO}_4$
1.074	10.675	0.245	"	1.375	54.944	1.495	"
1.113	16.060	0.366	"	1.448	66.231	2.142	"
1.151	21.684	0.587	"	1.516	76.906	1.971	$\text{PbH}_4(\text{PO}_4)_2$
1.190	27.263	0.821	"	1.549	82.190	1.547	"
1.227	32.809	0.954	"	1.576	86.406	1.190	"
1.264	39.184	1.001	"	1.635	95.696	0.774	"

Zharovskii, 1951 gives the  $K_{sp}$  of  $\text{PbHPO}_4$  at 18-20° as  

$$[\text{Pb}^{++}][\text{HPO}_4^-] = 1.4 \times 10^{-10}.$$

## S LEAD SULFIDE PbS

### SOLUBILITY OF LEAD SULFIDE IN WATER

t°	Gm. Mols. PbS per liter	Authority
18	$3.6 \times 10^{-6}$	(Weigel, 1907)
25	$0.94 \times 10^{-6}$	(Nims and Bonner, 1929)
25	$4.3 \times 10^{-4}$ (1)	(Karaoglanov and Sagortschev, 1929)
25	$5.7 \times 10^{-4}$ (2)	(Karaoglanov and Sagortschev, 1929)
25	$3.62 \times 10^{-11}$ (3)	(Ravitz, 1936)
25	$6.8 \times 10^{-4}$ (4)	(Micwitz, 1928)

(1) Solid Phase amorphous PbS; (2) Solid Phase Cryst. PbO;  
 (3) Value recommended on the basis of a study of the published determinations of others (4) Gms. PbS per 1000 gms. sat. solution.

The solubility product, calculated from thermodynamic data, was found by Kapustinsky, 1940 to be  $6.8 \times 10^{-29}$ . The calculated solubility in solutions of varying acidity is as follows: (25°)

pH:	3	5	7	9	11
Gm. moles per liter	$7.9 \times 10^{-7}$	$8 \times 10^{-9}$	$1.1 \times 10^{-10}$	$8.2 \times 10^{-12}$	$8.2 \times 10^{-13}$

Goates, Gordon and Faux, 1952 calculate the  $K_{sp}$  at  $25^\circ$  to be  $8 \times 10^{-28}$  from thermodynamic data.

Fusion-point data are given for:

PbS + $Ag_2S$	(Friedrich, 1908)
PbS + $ZnS$	(Friedrich, 1908)
PbS + $Sb_2S_3$	(Wagemann, 1912; Savul, 1940)
PbS + $Tl_2S$	(Cannieri and Fernandes, 1925)
PbS + $SiS_2$	(Cambi, 1912)

LEAD SULFITE  $PbSO_3$ 

SO

EQUILIBRIUM IN THE SYSTEM LEAD OXIDE, SULFUR DIOXIDE AND WATER  
(Terres and Ruhl, 1934)

The determinations were made by the synthetic method. The results are given in the present paper only in the form of a small diagram from which the following approximate values were read.

Results at  $15^\circ$ 

Mol. % in sat. sol.		Solid Phase
PbO	SO <sub>2</sub>

\*Between 11 and 95 Mol. Percent  $SO_2$  the mixtures separate into liquid layers.

SOLUBILITY OF  $PbSO_3$  IN AQUEOUS AMMONIUM ACETATE SOLUTIONS  
(Mangan, 1949)

Moles $NH_4OAc$ per liter	Mmol. $PbSO_3$ per liter	Moles $NH_4OAc$ per liter	Mmol. $PbSO_3$ per liter
0.5	3.86	3.0	34.12
1.0	8.00	4.0	54.00
1.5	13.24	5.0	80.24
2.0	19.98		

Data for the solubility of  $PbSO_3$  in aqueous ammonium acetate solutions at different temperatures and pH are also given by Mangan, 1949.

**Pb LEAD**

**SO LEAD SULFATE PbSO<sub>4</sub>**

**SOLUBILITY IN WATER**

(Average curve from gravimetric results of Dibbitts (1874), Beck and Stegmüller (1910) and Pleissner (1907) and conductivity results of Böttger (1903) and Kohlrausch (1904-05).

t°	Gms. PbSO <sub>4</sub> per Liter	t°	Gms. PbSO <sub>4</sub> per Liter
0	0.028	20	0.041
5	0.031	25	0.045
10	0.035	30	0.049
15	0.038	35	0.052
18	0.040	40	0.056

Later determinations of the solubility of lead sulfate in water by Crockford and Brawleys, 1934; Purdum and Rutherford, 1933; Kolthoff and Rosenblum, 1933; and Huybrechts and de Langeron, 1930, gave an average curve from which the following values were taken.

t°	Gms. PbSO <sub>4</sub> per Liter	t°	Gms. PbSO <sub>4</sub> per liter
0	0.0330	25	0.0452
5	0.0354	30	0.0476
10	0.0380	35	0.0500
15	0.0403	40	0.0526
20	0.0427	50	0.0574

Koizumi, 1950 reports that the effect of dissolved CO<sub>2</sub> on the solubility of PbSO<sub>4</sub> is negligible.

**SOLUBILITY OF LEAD SULFATE IN SULFURIC ACID SOLUTIONS**

Results of Crockford and Brawley, 1936; Crockford and Addlestone, 1936

In agreement with Donk, 1916, analyses of the solid phases showed that PbSO<sub>4</sub> is the only one at these temperatures. The eutectic temperature for PbSO<sub>4</sub> + H<sub>2</sub>SO<sub>4</sub> was found to be 5.4°. The acid concentration of 104 percent H<sub>2</sub>SO<sub>4</sub> corresponds to 80.5 percent SO<sub>3</sub>.

SO

## Results at 20°

The only fairly closely agreeing results of Pleissner, 1907; Sehnal, 1909; Dawkins and Weldon, 1932; Huybrechts and Ramelot, 1926 and Purdum and Rutherford, 1933, were plotted and the following values were read from the average curve.

Gms. per liter		Gms. per liter		Gms. per liter	
H <sub>2</sub> SO <sub>4</sub>	PbSO <sub>4</sub>	H <sub>2</sub> SO <sub>4</sub>	PbSO <sub>4</sub>	H <sub>2</sub> SO <sub>4</sub>	PbSO <sub>4</sub>
0.0	0.042	0.5	0.0055	10.0	0.0050
0.05	0.013	1.0	0.0040	20.0	0.0060
0.10	0.010	2.5	0.0040	50.0	0.0075
0.25	0.007	5.0	0.0045	100.0	0.0100

The available results at 30° are approximately one unit in the third place higher than the above values for the flat portion of the curve corresponding to concentrations of sulfuric acid above 0.25 gms. per liter.

## Results of Craig and Vinal, 1939 at 0°, 25°

The purest lead sulfate and water were used. Analysis for lead was made by a carefully checked dithizone method, and the original data fall on a smooth curve. The following rounded results are given by the authors. The data agree with and extend those of Purdam and Rutherford, below.

Pb LEAD

SOLUBILITY OF PbSO<sub>4</sub> IN AQUEOUS SOLUTIONS OF NaCl AT 18°  
(Beck and Stegmuller, 1910)

Normality of NaCl	Mgm. Pb per 100 cc. Sol.
0.1	11.19
0.2	18.73
0.3	26.51
0.4	33.76

Data for the solubility of PbSO<sub>4</sub> in aqueous KCl + 0.001 N HCl solutions are given by Cavigli, 1950.

Solubilities of PbSO<sub>4</sub> in 0.1 M Li<sup>+</sup>, Na<sup>+</sup>, K<sup>+</sup>, Mg<sup>++</sup> and Al<sup>+++</sup>, NO<sub>3</sub><sup>-</sup> and SO<sub>4</sub><sup>=</sup> solutions at 25° are reported by Tananaev and Mizetskaya, 1951.

Data for the solubility of lead sulfate in various salt solutions of very low concentration are given by Ruchhoff and Kachmar, 1942.

$\text{PbSO}_4$  is 733 times as soluble in  $3N \text{ NaNO}_3$  solution as is water. (Belfiori, 1940.)

SOLUBILITY OF LEAD SULFATE IN AQUEOUS SOLUTIONS OF THORIUM CHLORIDE  
(Balcar and Stegmann, 1928)

To solutions of varying concentrations of thorium chloride, illuminated by a converging beam of light, equivalent solutions of lead chloride and sulfuric acid were added dropwise and the point determined at which the Tyndall cone became permanent. This was taken as the point representing saturation of the solution at  $25^\circ$ . (?)

<sup>a</sup>gms. per 100 gms. sat. sol. Cupery, 1938

**SeO LEAD SELENITE  $\text{PbSeO}_3$**

After seven days agitation at 10°, 11 mg. of  $\text{PbSeO}_3$  were found to be dissolved in 100 cc. of water. (Dolique, 1943.)

The Ksp at 20°, as determined from the solubility in dilute  $\text{HNO}_3$  and  $\text{H}_2\text{SO}_4$  solutions is  $3.4 (\pm 1.3) \times 10^{-12}$ . (Chukhlantsev and Tomashevskii, 1957.)

**LEAD SELENATE  $\text{PbSeO}_4$**

The Ksp at 25° is  $1.56 \times 10^{-6}$ . (Kapustinskii and Selivanova, 1949.)

Data for the solubility of  $\text{PbSeO}_4$  in aqueous solutions of  $\text{Li}_2\text{SeO}_4$ ,  $\text{K}_2\text{SeO}_4$  and  $\text{Na}_2\text{SeO}_4$  at 25° are given by Selivanova and Boguslavskii, 1955.

**LEAD TANTALATE  $\text{Pb}_8\text{Ta}_{12}\text{O}_{38} \cdot 33\text{H}_2\text{O}$**

The solubility is 5.17 mg./liter. (Efimov, Pchelkin and Lapitskii, 1954.)

LEAD TITANATE  $\text{PbTiO}_3$ 

Melting point data are given for:

$\text{PbTiO}_3 + \text{BaTiO}_3 + \text{CaTiO}_3$  (Ikeda, 1958)  
 $\text{PbTiO}_3 + \text{BaTiO}_3 + \text{K}_2\text{F}_2$  (Sholokhovitch, Fesenko, Kramarov and Khodakov, 1956)  
 $\text{PbTiO}_3 + \text{BaTi}$   
 $\text{PbTiO}_3 + \text{Na}_2\text{CO}_3, + \text{K}_2\text{CO}_3, + \text{KF}, + \text{Na}_2\text{MoO}_4,$  (Belyaev, Sholokhovitch and Barkova, 1954)  
 $+ \text{K}_2\text{MoO}_4, + \text{NaSiO}_3, + \text{K}_2\text{SiO}_3, + \text{NaVO}_3,$   
 $+ \text{KVO}_3, + \text{Na}_2\text{WO}_4$  (binary systems)

LEAD VANADATE  $\text{Pb}(\text{VO}_3)_2$ 

The Ksp at  $18^\circ$  is  $6.8 \times 10^{-12}$ . (Zolotavir, 1947.)

LEAD TUNGSTATE  $\text{PbWO}_4$ 

WO

The solubility in water at  $25^\circ$  is 0.0159 gms. per liter of saturated solution. (Berkem, 1943.)

## PALLADIUM Pd

Pd

The distribution of metallic palladium in the system Fe + FeS at the eutectic temperature was studied by Noddack, Noddack, and Bohnstedt (1940).

Data for the system Pd - H up to  $313^\circ$ , 35 atmospheres are given by Gillespie and Galstaun, 1936.

## PALLADIUM-DIMETHYLGLYOXIME

SOLUBILITY IN HYDROCHLORIC ACID SOLUTIONS AT  $25^\circ$   
 (Murontsev, 1955)

Solvent: Wt. % HCl	Gms. Pd - DMG per liter
0.5	0.0022
1.0	0.0044
3.0	0.0120
3.0 + 5% NaCl	0.0152
3.0 + 10% NaCl	0.0230
5.0	0.0192
10.0	0.0369

## Pd PALLADIUM

### Cl PALLADIUM CHLORIDE $\text{PdCl}_2$

When 1 gm. of palladium, as chloride, is dissolved in 100 cc. of  $\text{H}_2\text{O}$  and shaken with 100 cc. of ether, 0.02% of the metal enters the ethereal layer at ordinary temperature. When aqueous 10%  $\text{HCl}$  is used, 0.01% of the metal enters the ethereal layer. (Mylius, 1911.)

Data for the extraction of palladium from aqueous  $\text{HCl}$  solutions by ether are also given by Bock, 1951.

100 cc. anhydrous hydrazine dissolve 1 gm.  $\text{PdCl}_2$ , with evolution of gas and formation of a black precipitate, at room temperature. (Welsh and Broderson, 1915.)

### PALLADIUM (OUS) AMMINO CHLORIDE

#### SOLUBILITY IN HYDROCHLORIC ACID SOLUTIONS AT 10° (Murontsev, 1955)

Wt. % $\text{HCl}$	Gms. salt per liter
1.0	0.0440
3.0	0.0452
5.0	0.0456

### PALLADIUM ACETOXIME SALTS

PRAESEODYMIUM ACETATE  $\text{Pr}(\text{CH}_3\text{COO})_2 \cdot \text{H}_2\text{O}$

CH

100 gms. sat. solution of praseodymium acetate in water contain 21.48 gms.  $\text{Pr}(\text{CH}_3\text{COO})_2$  at 25°. Saturation was obtained by constant shaking. (Meyer and Muller, 1920.)

PRAESEODYMIUM GLYCOLATE  $\text{Pr}_2(\text{C}_2\text{H}_3\text{O}_3)_3$

One liter water dissolves 3.578 gms.  $\text{Pr}_2(\text{C}_2\text{H}_3\text{O}_3)_3$  at 20°. (Jantsch and Grünkraut, 1912-1913.)

PRAESEODYMIUM LACTATE  $\text{Pr}(\text{C}_3\text{H}_5\text{O}_3)_3 \cdot 2\frac{1}{2}\text{H}_2\text{O}$

1000 cc. sat. solution of praseodymium lactate in water contain 24.84 gms.  $\text{Pr}(\text{C}_3\text{H}_5\text{O}_3)_3 \cdot 2\frac{1}{2}\text{H}_2\text{O}$  at 20°. Saturation was obtained by constant shaking.

PRAESEODYMIUM SORBATE  $\text{Pr}(\text{C}_5\text{H}_7\text{COO})_3$

The solubility in water is 0.001891 moles per liter at 20° (Bergamini, 1949.)

# Pr PRASEODYMIUM

## PRASEODYMIUM SODIUM ETHYLENEDIAMINE TETRA ACETATE $\text{Na}[\text{Pr}(\text{C}_6\text{H}_4\text{N}_2\text{O}_8)]$

The solubility in water at 25° is 0.078 moles per 1000 gms. sat. solution. (Moeller, Moss and Marshall, 1955.)

# CH PRASEODYMIUM SULFONATES

A sat. solution of Pr(NO<sub>3</sub>)<sub>3</sub>·6H<sub>2</sub>O in ethyl ether, prepared by frequent agitation and allowing to stand over night at about 20°, contained 0.004 gm. Pr<sub>2</sub>O<sub>3</sub> per 100 cc. (Wells, 1930.)

Data for the distribution of Pr(NO<sub>3</sub>)<sub>2</sub> between aqueous acids and salts and tributyl phosphate are reported by Knapp, Smutz and Spedding, 1956.

PRASEODYMIUM OXIDE, HYDROXIDE  $\text{Pr}_2\text{O}_3$ ,  $\text{Pr}(\text{OH})_3$ 

OH

One liter sat. solution of praseodymium oxide in water contains 0.0000061 gm. mol.  $\text{Pr}_2\text{O}_3$  at  $29^\circ$ , as determined by electrometric titration. The corresponding value for  $\text{Pr}_6\text{O}_{11}$  is 0.0000039 at  $29^\circ$ . (Busch, 1927.)

Korenman, 1955 reports the  $K_{sp}$  of  $\text{Pr}(\text{OH})_3$  to be  $7 \times 10^{-24}$  from data on the pH at precipitation.

Data for the precipitation of  $\text{Pr}(\text{OH})_3$  from ammonium acetate solutions is given by Perey, 1949.

 PRASEODYMIUM DIMETHYL PHOSPHATE  $\text{Pr}_2[(\text{CH}_3)_2\text{PO}_4]_6$ 

100 gms.  $\text{H}_2\text{O}$  dissolve 64.1 gm.  $\text{Pr}[(\text{CH}_3)_2\text{PO}_4]_6$  at  $25^\circ$ . (Morgan and James, 1914.)

 PRASEODYMIUM SULFATE  $\text{Pr}_2(\text{SO}_4)_3$ 

SO

## SOLUBILITY OF PRASEODYMIUM SULFATE IN WATER

The somewhat irregular results of Muthmann and Rolig, 1898; Meyer, and Jackson and Rienacker, 1930, were plotted and the following values taken from the average curve drawn through them.

Gms. $\text{Pr}_2(\text{SO}_4)_3$ per t° 100 gms. sat. sol. Solid Phase			Gms. $\text{Pr}_2(\text{SO}_4)_3$ per t° 100 gms. sat. sol. Solid Phase

## Pt PLATINUM

### SOLUBILITY OF PLATINUM IN MERCURY (Plaksin and Suvorovskaya, 1940, 1941, 1945)

The system platinum - mercury was studied by thermal, X-ray, and microscopic methods and the phase diagrams drawn. Mercury dissolves in

platinum up to 23 atomic %, and forms 3 compounds. The solubility of platinum in mercury is as follows:

Temperature:	16.5°	144°	200°
Atomic % Pt	0.0205	1.08	1.77

The distribution of metallic platinum between Fe and FeS at the eutectic temperature of the system was studied by Noddack, Noddack, and Bohnstedt, 1940.

60	74.00	$\text{PtCl}_4 \cdot 4\text{H}_2\text{O}$			

<sup>a</sup>agrees with Genke, 1926

### DISTRIBUTION OF PLATINUM CHLORIDE BETWEEN WATER AND ETHER AT ORDINARY TEMPERATURE (Mylus, 1911)

When 1 gm. of platinum as chloride is dissolved in 100 cc. of aqueous 10% HCl and shaken with 100 cc. of ether, 0.01 per cent of the platinum enters the ethereal layer. If water is used instead of 10% HCl, approximately the same per cent of Pt enters the ether layer.

100 cc. anhydrous hydrazine dissolve 1 gm. platinic chloride, with formation of a black precipitate at room temperature. (Welsh and Broderson, 1915.)

PLATINUM IODIDE  $\text{PtI}_4$ 

Data for the solubility of  $\text{PtI}_4$  in aqueous KI solutions are given by Tanannaev, 1948. The solid phase is  $\text{PtI}_4$  up to 0.6 mol. KI per liter; above it is  $\text{K}_2\text{PtI}_6$ . The solubility of the latter salt is approximately 0 when the solution is saturated with KI.

PLUTONIUM OXALATE  $\text{Pu}(\text{C}_2\text{O}_4)_2 \cdot 6\text{H}_2\text{O}$ 

CO

SOLUBILITY IN AQUEOUS SOLUTIONS AT 20°  
(Moskvin and Gel'man, 1958)

Water	$1.03 \times 10^{-4}$ moles $\text{Pu}(\text{C}_2\text{O}_4)_2$ per liter
In $\text{H}_2\text{SO}_4$	$8.0 \times 10^{-4}$ moles $\text{Pu}(\text{C}_2\text{O}_4)_2$ per liter
In $\text{HNO}_3$	$2.25 \times 10^{-4}$ moles $\text{Pu}(\text{C}_2\text{O}_4)_2$ per liter
In $\text{HClO}_4$	$1.57 \times 10^{-4}$ moles $\text{Pu}(\text{C}_2\text{O}_4)_2$ per liter

Solubilities in  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  and in  $\text{HNO}_3$  and  $\text{HClO}_4$  are given by Gel'man and Moskvin, 1958. Minimum solubility in  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  was  $3.55 \times 10^{-5}$  mol. Pu per liter.

## Pu PLUTONIUM

### PLUTONIUM ACETYLACETONATE

Data for the distribution of the acetylacetone complex between benzene and water, chloroform and water, and methyl isobutyl ketone and water at 25° are given by Rydberg, 1955.

### F PLUTONIUM FLUORIDE $\text{PuF}_3$

Data for the solubility of  $\text{PuF}_3$  in  $\text{NaF} - \text{BeF}_2$  and  $\text{LiF} - \text{BeF}_2$  mixtures is given by Barton, Grimes and Strehlow, 1958.

### PLUTONYL FLUORIDE $\text{PuO}_2\text{F}_2$

The solubility in water at 20° is 1.07 gms. per liter. (Alenchenkova, et al., 1958.)

Data for the preparation and relative solubilities of various double fluorides are reported by Anderson, 1949, 1949a.

### NO PLUTONIUM NITRATE $\text{Pu}(\text{NO}_3)_4$

Partition data for plutonium are given in the following systems:

$[\text{Pu IV, VI}]$  (20°) aqueous  $\text{HNO}_3 + \text{Ca}(\text{NO}_3)_2$  - methyl isobutyl ketone  
(Rydberg and Bernstrom, 1957)

$[\text{Pu}(\text{NO}_3)_4, \text{PuO}_2(\text{NO}_3)_2]$  aqueous  $\text{HNO}_3$  - tributyl phosphate  
(Alcock, Best, Hesford, McKay, 1958)

$[\text{Pu}(\text{NO}_3)_4, \text{PuO}_2(\text{NO}_3)_2]$  aqueous  $\text{HNO}_3$  - tributyl phosphate  
(Healy and McKay, 1956)

Solubilities of Pu IV and VI nitrates in "Butex" at 25° are reported by Dawson (1957). Data for solubilities of other Pu compounds are also given.

### OH PLUTONIUM HYDROXIDE $\text{Pu}(\text{OH})_4$

The  $K_{sp}$  is  $7.1 \times 10^{-56}$  at 25° (Kasha, 1949).

PLUTONIUM PHOSPHATE  $\text{Pu}_2\text{H}(\text{PO}_4)_3 \cdot x\text{H}_2\text{O}$ 

PO

SOLUBILITY IN DILUTE ACIDS AT 25°  
(King, 1949)

After equilibration,  $\text{Pu}_2\text{H}(\text{PO}_4)_3 \cdot x\text{H}_2\text{O}$  was converted to  $\text{Pu}(\text{HPO}_4)_2 \cdot y\text{H}_2\text{O}$ . The approach to saturation was slow in each case. Results in micrograms Pu IV per milliliter.

Solvent	time of equilibration, days		
	4	10	34
2.08 M $\text{HNO}_3$ + 1.20 M $\text{H}_3\text{PO}_4$	38	46	56
2.08 M $\text{HNO}_3$ + 0.90 M $\text{H}_3\text{PO}_4$	67	80	104
2.08 M $\text{HNO}_3$ + 0.60 M $\text{H}_3\text{PO}_4$	110	135	184

Data for the solubility of gelatinous  $\text{Pu}(\text{HPO}_4)_2 \cdot y\text{H}_2\text{O}$  at 25° in 2.08 M  $\text{HNO}_3$  containing 0 - 1.20 M  $\text{H}_3\text{PO}_4$  and in 0.832 M  $\text{HNO}_3$  + 1.25 M  $\text{NaNO}_3$  with up to 1.21 M  $\text{H}_3\text{PO}_4$  are also reported by King, 1949.

PLUTONIUM SULFATE  $\text{Pu}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$ 

SO

(Results of Anderson, 1949c)

Solvent			Solubility of Pu (gms./liter)
mg. $\text{H}_2\text{SO}_4$	ml. alcohol	total vol. (ml.)	
0.1	0	0.80	≥125
1.0	0	0.50	~90
9	0	0.200	1.66
12	0	0.300	3.13
2.7	$\text{CH}_3\text{OH}$ 0.100	0.380	5.6
7.2	$\text{C}_2\text{H}_5\text{OH}$ 0.0500	0.250	0.20
0.2 <sup>a</sup>	$\text{CH}_3\text{OH}$ 0.060	0.210	0.26
0.2 <sup>b</sup>	$\text{CH}_3\text{OH}$ 0.080	0.330	~ 0.40

<sup>a</sup>(+  $\text{CaSO}_4$ , 19 mg.)<sup>b</sup>(+  $\text{Na}_2\text{SO}_4$ , 14 mg.)

Anderson, 1949d reports the solubility of plutonium - thallium double sulfates  $\text{TlPu}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$  and  $\text{Tl}_3\text{Pu}(\text{SO}_4)_4$  in  $\text{H}_2\text{SO}_4$  solutions. Solid solutions of varying Tl/Pu are formed.

RADIUM EMANATIONS, see RADON Rn

## Ra RADIUM

### Br RADIUM BROMIDE, CHLORIDE and NITRATE

#### SOLUBILITY OF EACH SEPARATELY IN WATER AT 20° (Erbacher, 1930)

The experiments were made on a scale about one-two hundredth that ordinarily employed for solubility determinations. The results are of special interest in connection with the separation of radium from barium by fractional crystallization of their salts. The results are compared in the following table with those for the corresponding bromides, chlorides and nitrates of calcium, strontium and barium.

Salt	Gms. per 100 gms. sat. solution of the salts of:			
	Ca	Br	Ba	Ra
Bromide	58.8	50.0	51.0	41.4
Chloride	42.7	35.0	26.3	19.7
Nitrate	54.8	41.5	7.9	12.2

Results for the coefficient of distribution of radium and barium in the fractional crystallization of solutions of their bromides, are given by Walter and Schlundt, 1928.

The distribution of  $\text{Ra}(\text{NO}_3)_2$  between solutions saturated with  $\text{Ba}(\text{NO}_3)_2$  and  $\text{Pb}(\text{NO}_3)_2$  and the solid salts and mixed crystals of these salts has been extensively studied by Chlopin and his students; Chlopin and Polessitsky, 1928; Chlopin, Polessitsky and Tolmatcheff, 1929; Polessitsky, 1932.

The distribution of radium nitrate between liquid and solid salts at their melting points was determined by Chlopin and Klokman, 1949 for the following cases: in  $\text{Pb}(\text{NO}_3)_2$  with  $\text{NaNO}_3$  added; in  $\text{Ba}(\text{NO}_3)_2$  with  $\text{NaNO}_3$  added, in  $\text{PbSO}_4$  with  $\text{Li}_2\text{SO}_4$  added, in  $\text{Sr}(\text{NO}_3)_2$  with  $\text{KNO}_3$  added.

Data for the distribution of radium and thorium X between the solid and liquid phases of the system  $\text{Ca}(\text{NO}_3)_2$  -  $\text{Ra}(\text{NO}_3)_2$  -  $\text{NaNO}_3$  are given by Khlopin, Klokman and Pekelnaya, 1953.

### SO RADIUM SULFATE $\text{RaSO}_4$

#### SOLUBILITY IN WATER AND IN AQUEOUS SOLUTIONS OF SULFURIC ACID AT 25° (Lind, Underwood and Whitmore, 1918)

Constant agitation was employed and equilibrium was approached from above and from below. The dissolved radium sulfate was determined by the "emanation" method.

SOLUBILITY IN WATER AND IN AQUEOUS SOLUTIONS  
OF SULFURIC ACID AT 25°--Cont.

Conc. of H <sub>2</sub> SO <sub>4</sub>	Gm. x 10 <sup>-3</sup> RaSO <sub>4</sub> per 25 cc. sat. sol.	Conc. of H <sub>2</sub> SO <sub>4</sub>	Gm. x 10 <sup>-3</sup> RaSO <sub>4</sub> per 25 cc. sat. sol.
0.0 (=H <sub>2</sub> O)	2.1	30%	2.3
0.01 normal	2.0 (3.0 at 35°)	45%	1.9
0.10 normal	2.2	50%	2.1
1.0 normal	2.2	55%	3.4
10%	2.4	60%	6.3
15%	2.4	65%	6.4
25%	2.3 (3.3 at 35° and 5.0 at 45°)	70%	>79.0 (not sat.)

Subsequent determinations of the solubility of radium sulfate in water by Erbacher and Nikitin, 1931, made with special reference to the sources of error in the method, resulting from the adsorption of radium by the filtering medium, gave 0.00014 gm. RaSO<sub>4</sub> per 100 cc. H<sub>2</sub>O at 20°. This value is about 67 times greater than the above result by Lind and co-workers. In a later paper Nikitin and Tolmatscheff, 1933, revised this value to 0.00021 gm. RaSO<sub>4</sub> per 100 cc. H<sub>2</sub>O at 20°. They also found that the solubility of radium sulfate in solutions which contain sulfate ions follows the mass action law, taking into consideration the activity coefficient of both ions. The activity product at 20° is equal to 4.25 10<sup>-11</sup>.

**RUBIDIUM TETRAPHENYLBORATE RbB(C<sub>6</sub>H<sub>5</sub>)<sub>4</sub>**

8

0.576 γ of RbB(C<sub>6</sub>H<sub>5</sub>)<sub>4</sub> dissolve in 100 ml of H<sub>2</sub>O at 20° (Geilmann and Gebauhr, 1953).

**RUBIDIUM FLUOBORATE RbBF<sub>4</sub>**

0.6 gms. RbBF<sub>4</sub> dissolve in 100 gms. H<sub>2</sub>O at 17° (deBoer and van Lempt, 1927; van Lempt, 1927).

<sup>a</sup>Lannung, 1934

<sup>b</sup>Fajans and Karagunis, 1931

### SOLUBILITY OF RUBIDIUM BROMIDE IN VARIOUS SOLVENTS

Solvent	t°	Solvent
Acetone	18	0.00505 gms. RbBr per 100 gms. solvent (Lannung, 1932)
	37	0.0047 gms. RbBr per 100 gms. solvent (Lannung, 1932)
Methanol	18	2.58 (d. = 0.809) gms. RbBr per 100 gms. solvent (Pavlopoulos and Strehlow, 1954)
	25	2.52 (d. = 0.804) gms. RbBr per 100 gms. solvent (Pavlopoulos and Strehlow, 1954)
Acetonitrile	18	0.061 gms. RbBr per 100 gms. solvent (Pavlopoulos and Strehlow, 1954)
	25	0.047 gms. RbBr per 100 gms. solvent (Pavlopoulos and Strehlow, 1954)
Formic acid	18	49.8 (d. = 1.602) gms. RbBr per 100 gms. solvent (Pavlopoulos and Strehlow, 1954)
	25	50.6 (d. = 1.595) gms. RbBr per 100 gms. solvent (Pavlopoulos and Strehlow, 1954)
Ethyl urethan	60	0.566 gms. RbBr per 100 cc. sat. sol. (Stuckgold, 1917)
Liquid ammonia	0	18.23 gms. RbBr per 100 gms. sat. sol. (Linhard and Stephen, 1934)

A solution containing 8.7 wt. % iodine in benzene is in equilibrium with excess solid iodine and rubidium bromide. (Foote and Fleischer, 1940.)

### THE SYSTEM RbBr - RbCl - H<sub>2</sub>O AT 25° (Durham, Rock and Frayn, 1953)

Liquid Solution Wt. %		Solid Solution Wt. % RbBr	Liquid Solution Wt. %		Solid Solution Wt. % RbBr
RbBr	RbCl		RbBr	RbCl	
0.0	48.48	0.0	24.85	28.82	54.4
4.29	45.33	1.06	34.79	18.69	82.9
13.78	37.90	17.72	34.90	18.69	82.3
13.63	37.95	16.82	44.84	8.35	94.6
21.41	31.87	39.8	52.72	0.0	100.0

Melting-point data are given for:

RbBr + AgBr	(Sandonnini, 1912a)
RbBr + LiBr	(Gromakov and Gromakova, 1953)
RbBr + PbBr <sub>2</sub>	(Gromakov, 1950)

Reaction in the system RbBr + CaF below the melting points was studied with X-rays by Link and Wood, 1940.

Solid solutions in the system RbBr - RbCl in the range 148 - 223°K are reported by Hovi, 1954.

#### RUBIDIUM IODO BROMIDE RbIBr<sub>2</sub>

Br

100 gms. sat. solution of rubidium iodo bromide in water contain about 44 gms. RbIBr<sub>2</sub> and the solution has d. = 3.84 at about 20°(?). (Wells and Wheeler, 1892.)

One liter sat. solution of rubidium iodo bromide in carbon tetrachloride contains 0.001 gm. mol. RbIBr<sub>2</sub> at 25°. (Cremer and Duncan, 1931.)

#### RUBIDIUM BROMATE RbBrO<sub>3</sub>

BrO

100 gms. H<sub>2</sub>O dissolve 2.93 gms. RbBrO<sub>3</sub> at 25°, 3.55 gms. at 30°, 4.28 gms. at 35° and 5.08 gms. at 40°. (Buell and McCrosky, 1921.)

#### RUBIDIUM METHIONATE and CHLORMETHIONATE

CH

##### SOLUBILITY OF EACH IN WATER AT 25°

CrO

RUBIDIUM DICHROMATE Rb<sub>2</sub>Cr<sub>3</sub>O<sub>7</sub>

SOLUBILITY OF THE POLYMORPHIC FORMS IN WATER  
(Stortenbecker, 1907; see also Wyruboff, 1910)

t°	Gms. Rb <sub>2</sub> Cr <sub>3</sub> O <sub>7</sub> per 100 Gms. Sat. Sol.	
	Monoclinic Form	Triclinic Form
18	5.42	4.96
24	6.94	6.55
30	9.08	8.70
40	13.22	12.90
50	18.94	18.77
65	28.10	27.30

100 gms. sat. aq. solution contain 9.47 gms. Rb<sub>2</sub>Cr<sub>3</sub>O<sub>7</sub>, at 30°. (Schreinemakers and Filippo, Jr., 1906.)

## RUBIDIUM FLUORIDE RbF

F

100 gms. sat. solutions of rubidium fluoride in water contain 75.06 gm. RbF at 18°. (Lannung, 1934.) An earlier determination by de Forcrand, 1911 gave 56.6% at 18°. (Solid phase RbF·1<sup>1</sup>/<sub>2</sub>H<sub>2</sub>O)

RUBIDIUM FLUOPHOSPHATE RbPF<sub>6</sub>

One liter of sat. sol. contains 0.0758 moles RbPF<sub>6</sub> at 25°. (Lange and Muller, 1930.)

## Rb RUBIDIUM

### RUBIDIUM FLUOPLATINATE $\text{Rb}_2\text{PtF}_6$

100 ml. of sat. sol. contain 0.278 gms.  $\text{Rb}_2\text{PtF}_6$  at 25°. (Wheeler, Perros and Naeser, 1955.)

### RUBIDIUM FLUOSILICATE $\text{Rb}_2\text{SiF}_6$

100 gms.  $\text{H}_2\text{O}$  dissolve 0.16 gms.  $\text{Rb}_2\text{SiF}_6$  at 20°, and 1.36 gms. at 100°. (Stolba, 1867.)

### F RUBIDIUM FLUOTITANATE $\text{Rb}_2\text{TiF}_6$

100 ml. sat. sol. in water contain 0.8 gm.  $\text{Rb}_2\text{TiF}_6$  at 20 - 22°. (Ginsberg, 1932.)

1000 gms. acetone,  $(\text{CH}_3)_2\text{CO}$ , dissolve 0.0036 gm.  $\text{RbF}$  at 18° and 0.0039 at 37°. (Lannung, 1932.)

Melting point data are given for the following:

$\text{RbF} + \text{HF}$	(Webb and Prideaux, 1938)
$\text{RbF} + \text{YF}_3 + \text{LaF}_3 + \text{AlF}_3$	(Dergunov, 1948)
$\text{RbF} + \text{WO}_3$	(Schmitz-Dumont, Bruns and Heckmann, 1953)
$\text{RbF} + \text{MoO}_3$	(Schmitz-Dumont and Heckmann, 1952)
$\text{RbF} + \text{Rb}_2\text{MoO}_4 + \text{Rb}_2\text{CrO}_4 + \text{Rb}_2\text{WO}_4$	(Schmitz-Dumont and Weeg, 1951)
$\text{RbF} + \text{ErF}_3 + \text{SmF}_3 + \text{PrF}_3$	(Durgunov, 1952)
$\text{RbF} + \text{RbTi}_2\text{O}_5$	(Schmitz-Dumont and Schulz, 1952)
$\text{RbF} + \text{Rb}_2\text{SO}_4$	(Schmitz-Dumont and Heckmann, 1949)
$\text{RbF} + \text{BeF}_2$	(Grebenshchikov, 1957)

Reactions in the systems  $\text{RbF} - \text{CaCl}_2$ ,  $\text{RbF} - \text{CsBr}$ , and  $\text{RbF} - \text{CsI}$  below the melting points were studied with X-rays by Link and Wood, 1940.

98.4	21.5	15.4	Iodine + Two Liquids + Vapor
98.4	83.4	10.9	Iodine + Two Liquids + Vapor

Additional polythermal data for the system are also given.

The system RbI + SbI<sub>3</sub> + H<sub>2</sub>O at 12° was studied by Francois, 1937, but the author gives his results only in the form of a small diagram from which numerical values can not be obtained. The double salt 3RbI.2SbI<sub>3</sub> was identified and the existence of another probably of the composition 3RbI.SbI<sub>3</sub> was indicated.

The temperature-composition data for the system RbI + I for the range 60° to 238° are given by Briggs and Patterson, 1932. The solid phases in contact with the melt are I, RbI<sub>3</sub> and RbI.

100 gms. sat. solution of rubidium iodide in liquid ammonia contain 65.15 gm. RbI at 0°. (Linhard and Stephan, 1934.)

Results for the vapor-pressure, temperature relations of the system RbI + SO<sub>2</sub> are given by Foote and Fleischer, 1931.

Fusion-point data for RbI + AgI are given by Sandonnini (1912a).

Reaction in the system RbI - CsF below the melting points has been studied with X-rays by Link and Wood, 1940.

RUBIDIUM IODATE  $\text{RbIO}_3$

100 gms.  $\text{H}_2\text{O}$  dissolve 2.1 gms.  $\text{RbIO}_3$  at 23°. (Wheeler, 1892.)

RUBIDIUM PERIODATE  $\text{RbIO}_4$ 

100 gms.  $\text{H}_2\text{O}$  dissolve 0.65 gm.  $\text{RbIO}_4$  at 13°,  $d_{16}^4$  of sat. solution = 1.0052. (Barker, 1908.)

RUBIDIUM PERMANGANATE  $\text{RbMnO}_4$ 

MnO

One liter of aqueous solution contains 6.03 gms.  $\text{RbMnO}_4$  at 7°. (Muthmann and Kuntze, 1894.)

100 cc. sat. aqueous solution contain 0.46 gm.  $\text{RbMnO}_4$  at 2°, 1.06 gms. at 19° and 4.68 gms. at 60°. (Patterson, 1906.)

RUBIDIUM MOLYBDATE  $\text{Rb}_2\text{MoO}_4$ 

MoO

The solubility in water at 18° is 6.4 moles per liter, or 67.88 gms.  $\text{Rb}_2\text{MoO}_4$  per 100 gms. sat. sol. (Spitsyn and Kuleshov, 1951.)

RUBIDIUM PARAMOLYBDATE  $5\text{Rb}_2\text{O} \cdot 0.12\text{MoO}_3 \cdot \text{H}_2\text{O}$ 

100 cc. sat. aq. solution contain 1.941 gms. of the salt at 24°. (Wempe, 1912.)

RUBIDIUM HYDROXIDE  $\text{RbOH}$

OH

A phase diagram of the system  $\text{RbOH} - \text{H}_2\text{O}$  is given by Rollet, Cohen-Adad, Michaud and Tranguard, 1958. 4, 3, 2, 1 and  $\frac{1}{3}$  hydrates are formed (3 -  $\text{H}_2\text{O}$  is metastable). Invariant points are as follows:

## Rb RUBIDIUM

### Invariant Points in the system $\text{RbOH} - \text{H}_2\text{O}$

$t^\circ$	Wt. % RbOH	Solid Phase
-72.5	47.4	$\text{Ice} + \text{RbOH} \cdot 4\text{H}_2\text{O}$
-76.7	48.8 <sup>m</sup>	$\text{Ice} + \text{RbOH} \cdot 3\text{H}_2\text{O}$
-52.5	55.9	$\text{RbOH} \cdot 4\text{H}_2\text{O} + \text{RbOH} \cdot 2\text{H}_2\text{O}$
-57.0	55.5 <sup>m</sup>	$\text{RbOH} \cdot 3\text{H}_2\text{O} + \text{RbOH} \cdot 2\text{H}_2\text{O}$
-73.5	65.4	$\text{RbOH} \cdot 3\text{H}_2\text{O} + \text{RbOH} \cdot 4\text{H}_2\text{O} + \text{RbOH} \cdot 2\text{H}_2\text{O}$
+47	73.8	$\text{RbOH} \cdot 2\text{H}_2\text{O} + \text{RbOH} \cdot \text{H}_2\text{O}$
145 m. pt.	85.0	$\text{RbOH} \cdot \text{H}_2\text{O}$
95	90.6	$\text{RbOH} \cdot \text{H}_2\text{O} + \text{RbOH} \cdot \frac{1}{3}\text{H}_2\text{O}$
104	91.4	$\text{RbOH} \cdot \frac{1}{3}\text{H}_2\text{O} + \text{RbOH} - \alpha$
235	95.5	$\text{RbOH} - \alpha + \text{RbOH} - \beta$

OH

<sup>m</sup>metastable

100 gms. sat. aqueous solution contain 63.39 gms. RbOH at  $30^\circ$   
(Schreinemakers and Philipp, 1906.)

100 gms. sat. aqueous solutions contain 64.17 gms. RbOH at  $15^\circ$ .  
(de Forcrand, 1909a.)

The solubility of RbOH in liquid  $\text{HN}_3$  is 0.9 gms. per 100 ml.  
at  $-40^\circ$ .

Fusion-point data for mixtures of  $\text{RbOH} + \text{NaOH}$  are given by  
v. Hevesy, 1900.

## ReO RUBIDIUM PERRHENATE $\text{RbReO}_4$

### SOLUBILITY IN WATER

Results of Smith and Long, 1948		Results of Moddak and Moddak, 1931

0.25 M $(\text{NH}_4)_2\text{S}$	0.13	0.90			

## Rh RHODIUM

## Rh RHODIUM Rh

The distribution of rhodium in the system Fe + FeS at the eutectic temperature was determined by Noddack, Noddack and Bohnstedt, 1940.

### RHODIUM AMMINE SALTS

Salt	t°	Solubility
$[\text{Rh}(\text{NH}_3)_6]\text{Cl}_3$	8	13.3 gms. per 100 gms. $\text{H}_2\text{O}$ (Jorgensen 1883, 1886, 1891)
$[\text{Rh}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$	0	0.00945 moles per liter sat. sol. (Bronsted and Petersen, 1921)
	17	0.56 gms. per 100 gms. $\text{H}_2\text{O}$ (Jorgensen 1883, 1886, 1891)
	20	0.020 moles per liter sat. sol. (Bronsted and Petersen, 1921)
	25	0.828 gms. per 100 gms. sat. sol. (Semzusni, 1927)
$[\text{Rh}(\text{NH}_3)_5\text{Br}]\text{Cl}_2$	20	0.015 moles per liter sat. sol. (Bronsted and Petersen, 1921)
$[\text{Rh}(\text{NH}_3)_6](\text{NO}_3)_3$	room	2.1 gms. per 100 gms. $\text{H}_2\text{O}$ (Jorgensen 1883, 1886, 1891)
$[\text{Rh}(\text{NH}_3)_3(\text{NO}_2)_3]$	10	0.0146 gms. per 100 gms. $\text{H}_2\text{O}$ (Petkov, 1949)
	20	0.0315 gms. per 100 gms. $\text{H}_2\text{O}$ (Petkov, 1949)
	25	0.0394 gms. per 100 gms. $\text{H}_2\text{O}$ (Petkov, 1949)
$[\text{Rh}(\text{NH}_3)_6]_2(\text{SO}_4)_3 \cdot 5\text{H}_2\text{O}$	20	2.3 gms. per 100 gms. $\text{H}_2\text{O}$ (Jorgensen 1883, 1886, 1891)
d,1 diammino cyclopentanes		(see Jaeger and Blumendal, 1928)

## RADON Rn

Early work referred to radon as "radium emanations."

### SOLUBILITY OF RADON IN WATER

Lawrence, et al (1946) reviewed the work of von Antropoff (1910, 1919) Valentiner (1927, 1930), Estreicher (1899), and Meyer (1913) on the solubility of radon in water and drew a smooth curve through the points given by all the authors. The agreement among the various results is not good, but those of Valentiner approximate the average curve. Other results are reported by Boyle, 1911 and Kofler, 1913. The data below were read from the average curve of Lawrence:

## SOLUBILITY OF RADON IN WATER--Cont.

t°	$\beta$	t°	$\beta$
0	0.51	40	0.14
10	.33	50	.115
20	.23	60	.098
30	.17	70	.088

$\beta$  = Bunsen adsorption coefficient: ml. gas measured at 0°, 760 mm. which dissolve in 1 ml. of solvent when the partial pressure of the gas is 760 mm.

## SOLUBILITY OF RADON IN ORGANIC SOLVENTS

(Compare values in each of the three tables following.)

## Results of Schulze, 1920

The results are given in terms of the Ostwald solubility expression  $l$ , which is the relation of the concentration of the gas in the liquid to that in the gas space.

Solubility of Radium Emanations,  $l$  in:

t°	Toluene	Ether	CHCl <sub>3</sub>	Acetone	CS <sub>2</sub>	CH <sub>3</sub> COOC <sub>2</sub> H <sub>5</sub>	C <sub>2</sub> H <sub>5</sub> OH	Hexane
- 18	27.0	29.1	28.4	10.7	50.3	13.6	11.4	35.2
- 10	22.5	-	23.8	9.3	41.5	-	-	28.5

RUTHENIUM TETRAOXIDE RuO<sub>4</sub>

Data for the distribution of RuO<sub>4</sub> between carbon tetrachloride and aqueous solutions of acids, bases and salts are given by Martin, 1954.

## SULFUR S

SOLUBILITY OF SULFUR IN AQUEOUS SODIUM SULFIDE SOLUTIONS  
(Kuster and Heberlein, 1905)

The results are expressed in terms of  $x$  which represents the number of S atoms dissolved for each Na<sub>2</sub> in the solution. The figures, therefore, show the atomic ratio of S to Na<sub>2</sub> in the saturated solution and at the same time, the sulfur content of the compound Na<sub>2</sub>S <sub>$x$</sub>  which is formed. In order to find the actual amount of sulfur dissolved per liter, it is only necessary to multiply the  $x$  value by the normality of the aqueous sodium sulfide solution used as solvent in the particular case.

A series of determinations made at 25°, by agitating aqueous sodium sulfide solutions with crystalline sulfur until equilibrium was reached, and then diluting each solution with an equal volume of water and shaking with excess of sulfur until equilibrium was again reached, gave the following results:

# S SULFUR

## SOLUBILITY OF SULFUR IN AQUEOUS SODIUM SULFIDE SOLUTIONS--Cont.

Normality of the Aq. Na <sub>2</sub> S Solution	$\bar{x}$ in the Result- ing Na <sub>2</sub> S <sub>x</sub>	Normality of the Aq. Na <sub>2</sub> S Solution	$\bar{x}$ in the Result- ing Na <sub>2</sub> S <sub>x</sub>
4	4.475	0.125 (32 hrs.)	5.225
2 (2 hrs.)	4.666	0.0625	5.239
1	4.845	0.03125	5.198
0.5	4.984	0.015625	5.034
0.25	5.115	0.007812 (r28 hrs.)	4.456

The figures in parentheses in the above table show the number of hours required for attainment of equilibrium in these three cases. The authors also made determinations of the influence of temperature on the amount of sulfur dissolved, and found that for a normal Na<sub>2</sub>S solution, the  $\bar{x}$  value did not vary appreciably from the figure given above, over the range 0° to 50°.

Results are also given showing the influence of the presence of NaCl and of KOH on the amount of sulfur dissolved by aqueous Na<sub>2</sub>S solutions. In the former case the solubility was distinctly lowered, while in the latter it was notably increased.

## SOLUBILITY OF SULFUR IN AQUEOUS SOLUTIONS OF ALKALIES AT THE ORDINARY TEMPERATURE (Caleagni, 1920)

	Gms. S per 100 cc. of sat. solution
Aq. Ammonia ( $\bar{d}$ = 0.888)	1.367
Aq. 66% KOH	17.70
Aq. 66% NaOH	24.55
Aq. saturated Mg(OH) <sub>2</sub>	0.014
Aq. saturated Ca(OH) <sub>2</sub>	0.112
Aq. saturated Ba(OH) <sub>2</sub>	2.60

No difference was found between solutions which had been kept in the dark and in the light.

## SOLUBILITY OF SULFUR IN HYDROGEN SULFIDE

(Walton and Whitford, 1928)

The mixtures were constantly stirred in a quartz tube with a quartz stirrer and the solution analyzed repeatedly until equilibrium had been reached. The analysis was made by adding acetone to decompose the persulfide. The solvents were then allowed to evaporate spontaneously and the residue of rhombic sulfur dried at 90° to constant weight as "sulfur not evolved as hydrogen sulfide." The existence of a compound having the composition  $H_2S_6$ , and stable below  $-1.45^\circ$  was established. Hydrogen disulfide ( $H_2S_2$ ) and hydrogen trisulfide ( $H_2S_3$ ) dissolve sulfur copiously. When these two liquids are saturated with sulfur at a given temperature the two resulting liquid phases have the same composition. The following results were obtained for the solubility of sulfur in the trisulfide of hydrogen.

t°	% S in sat. sol. not evolved as $H_2S$	t°	% S in sat. sol. not evolved as $H_2S$	t°	% S in sat. sol. not evolved as $H_2S$
-34.72	53.56	- 1.45	82.50	35.4	89.46

## S SULFUR

Specific gravity of solution saturated at 15° containing 26 gms. S per 100 gms. solution = 1.372.

### SOLUBILITY OF SULFUR IN CARBON DISULFIDE (Jacek, 1913)

Saturation was secured by constant agitation and all necessary precautions were taken for accurate work. Also see table above.

t°	Gms. S per 100 gms. CS <sub>2</sub>	t°	Gms. S per 100 gms. CS <sub>2</sub>	t°	Gms. S per 100 gms. CS <sub>2</sub>
-109.5	1.05	-65	3.674	-36.5	7.950
-86.0	2.24	-59	4.387	-25.0	10.960
-81.5	2.443	-47	5.889	-17.0	13.96
-74.0	2.89	-44	6.440	0.0	23.13

The following determinations upon this system were made by Hammik, Cousnes and Langford, 1928, by the method of chilling liquified sulfur.

t°	Percent S <sub>μ</sub> dissolved by CS <sub>2</sub>	t°	Percent S <sub>μ</sub> dissolved by CS <sub>2</sub>	t°	Percent S <sub>μ</sub> dissolved by CS <sub>2</sub>
155	4.3	196	35.0	260	38.6
160	9.1	210	38.7	263	37.7
170	18.4	213	38.8	271	39.9
175	22.7	223	37.1	279	37.9
178	23.5	227	39.0	280	39.3
186	28.7	229	40.7	287	39.9
240	33.9 <sup>a</sup>	242	39.6	271	35.9 <sup>a</sup>
245	24.2 <sup>a</sup>	260	33.7 <sup>a</sup>	290	33.2 <sup>a</sup>
254	30.8 <sup>a</sup>	261	32.6 <sup>a</sup>	299	31.7 <sup>a</sup>
		266	34.8 <sup>a</sup>		

<sup>a</sup>In these cases the droplets of sulfur were graded as fair, in all other cases, as good.

The surface tension and density of solutions of sulfur in carbon disulfide at 12°, 17°, and 25° have been accurately determined by Kapustinsky and Golutvin, 1947.

### SOLUBILITY OF SULFUR (S) IN CARBON DISULFIDE AND CARBON TETRACHLORIDE (Wigand, 1910)

When "insoluble" sulfur (S<sub>μ</sub>) is treated with CS<sub>2</sub> or CCl<sub>4</sub>, a small amount dissolves, depending upon the length of time of contact, temperature and nature of the solvent but not on the relative amount of solvent. This action is explained on the assumption that a partial transformation of S<sub>μ</sub> to soluble sulfur S<sub>λ</sub>, takes place.

Data for the fusion points of mixtures of rhombic sulfur and "insoluble" sulfur (S<sub>μ</sub>) and for monoclinic sulfur and "insoluble" sulfur (S<sub>μ</sub>) are given by Kruyt (1908).

## SOLUBILITY OF SULFUR IN SULFUR MONOCHLORIDE (Aten)

In a series of papers by Aten (1905-06, 1912, 1912-13, 1913, 1914 and 1914a), the preparation and properties of the four known modifications of sulfur are described. These are designated by the symbols, S<sub>λ</sub>, S<sub>μ</sub>, S<sub>π</sub> and S<sub>ρ</sub>.

S<sub>λ</sub> is ordinary rhombic sulfur and its molecule is considered to be composed of eight atoms of sulfur, S<sub>8</sub>.

S<sub>μ</sub> is the insoluble, so-called amorphous sulfur.

S<sub>π</sub> is obtained when ordinary sulfur is heated above its melting-point and quickly cooled; it is especially easily prepared by warming

$S_\lambda$  in sulfur chloride. Its molecule is probably represented by  $S_4$ .

$S_\rho$  was discovered by Engel and is prepared by mixing concentrated HCl, cooled to  $0^\circ$ , with saturated sodium thiosulfate solution. The precipitated NaCl is removed by filtration and the solution extracted with toluene. The aqueous layer soon yields a cloudy precipitate of  $S_\rho$ . The molecule of this sulfur is considered to have the composition  $S_6$ .

SOLUBILITY OF SULFUR ( $S_\lambda$ ) IN SULFUR MONOCHLORIDE ( $S_2Cl_2$ ) DETERMINED  
BY THE MELTING-POINT METHOD  
(Aten, 1905-06)

t° of Melting	Mol. % $S_8$ in Mixture	Solid Phase	t° of Melting	Mol. % $S_8$ in Mixture	Solid Phase	Cl

77.7	55.4	"				

More recent determinations of freezing-points in the above system are given by Lowry, McHatton and Jones, 1927.

Results for the solubility of sulfur in sulfur chloride, determined by the synthetic method upon mixtures as such and after preheating to various temperatures, are given by Hammick and Zvegintzof, 1928. These authors point out that the conclusions of Lowry, McHatton and Jones are incorrect in certain respects.

SOLUBILITY OF SULFUR ( $S_\mu$ ) IN SULFUR MONOCHLORIDE ( $S_2Cl_2$ )  
(Aten, 1912-13)

A preliminary experiment showed that if a solution of  $S_\lambda$  in sulfur monochloride, saturated at  $20^\circ$ , is heated to  $170^\circ$  and cooled, it will then dissolve as much  $S_\lambda$  as already required to saturate it. The following determinations were made by sealing known amounts of  $S_\lambda$  and  $S_2Cl_2$  in tubes, heating them to  $100^\circ$  for several hours and then cooling quickly to the indicated temperatures and shaking for  $\frac{1}{2}$  hour in the case of the  $0^\circ$  and  $25^\circ$  results and 2 hours in the case of the  $-60^\circ$  results. The saturated solutions were analyzed by oxidizing with HCl +  $HNO_3$  + Br and titrating the  $H_2SO_4$  after removing the volatile acids.

Experiments by Aten, 1918, showed that when rhombic sulfur is heated in sulfur chloride or toluene solutions, its solubility is increased, due to the transformation of rhombic sulfur to another form,  $S_7$ . This is accompanied by a change in the color of the solution. The increase in solubility is greater the more concentrated the original solution. The author studied the influence of temperature and of concentration, upon the transformation of sulfur dissolved in toluene. The mixtures containing different concentrations of sulfur, were heated respectively for 6 hours at 140°, 4 hours at 150° and 2 hours at 160°. They were cooled and the amount of sulfur remaining in solution after addition of a small quantity of rhombic sulfur and stirring for one hour at 0° was determined.

Mixtures heated at 140°		Mixtures heated at 150°		Mixtures heated at 160°	
% conc. of original solution	Gms. S per 100 gms. sat. sol. at 0°	% conc. of original solution	Gms. S per 100 gms. sat. sol. at 0°	% conc. of original solution	Gms. S per 100 gms. sat. sol. at 0°
3.4	1.18	3.6	1.25	3.2	1.25
6.2	1.42	6.6	1.50	6.2	1.54
9.2	1.64	10.6	1.79	15.0	2.40
22.0	2.69	22.6	2.96	21.6	3.00
27.6	3.23	30.1	3.54	30.0	3.64

The quantity of  $S_7$  formed in  $CS_2$  solutions is about equal to that formed in toluene and is much smaller than the quantity formed in sulfur chloride solutions.

SOLUBILITY OF SULFUR ( $S_7$ ) IN TOLUENE AT 0° AND AT 25°  
(Aten, 1913)

Comp. of Mixture in Atom % S	Solubility in Atom % S		Comp. of Mixture in Atom % S	Solubility in Atom % S	
	At 0°	At 25°		At 0°	At 25°
35	2.88	5.94	74	4.05	7.52
47	-	6.65	77	3.90	-
54	3.26	6.76	80	4.22	-
57	3.30	6.88	83	-	7.93
73	-	7.45	85	-	8.08

These results show that the greater the excess of  $S_{\pi}$ , the greater the solubility. It was found that under the same conditions, unchanged rhombic sulfur gives constant figures irrespective of the excess of S present. At 0°, 2.59 atom per cent  $S_{\lambda}$  was found and at 25°, 5.65 atom per cent.

RESULTS AT HIGHER TEMPERATURES, DETERMINED BY THE SYNTHETIC METHOD  
(Kruyt, 1908-09)

### SOLUBILITY OF SULFUR IN VARIOUS OTHER SOLVENTS

Solvent	t°	Solubility
Ethyl ether	0	0.080 g. rhombic S per 100 cc sat. sol. (Bronsted, 1906)
		0.113 g. monoclinic S per 100 cc sat. sol. (Bronsted, 1906)
	13	0.187 gms. per 100 gms. sat. sol. (Delaplace, 1922)
	23	0.283 gms. per 100 gms. sat. sol. (Delaplace, 1922)
	25.3	0.200 g. rhombic S per 100 cc sat. sol. (Bronsted, 1906)
		0.253 g. monoclinic S per 100 cc sat. sol. (Bronsted, 1906)
Ethyl formate	0	0.019 g. rhombic S per 100 cc sat. sol. (Bronsted, 1906)
		0.028 g. monoclinic S per 100 cc sat. sol. (Bronsted, 1906)
Aniline	130	85.3 g. S per 100 g. solvent (Cossa, 1868)
Glycerol	15.5	0.14 g. S per 100 g. solvent (Ossendowski, 1907)
Methylene Iodide	10	10 g. S per 100 g. solvent (Retgers, 1893)
Nicotine	100	10.6 g. S per 100 g. solvent (Kleven, 1872)
Lanoline (anhyd.)	45	0.38 g. S per 100 g. solvent (Klose, 1907)
Hydrazine	room	54 (decomp.) g. S per 100 g. solvent (Welsh and Broderson, 1915)
Benzoyl chloride	0	1 gm. per 100 gm. sat. sol. (Bogousky, 1905)
	134	55.8 gm. per 100 gm. sat. sol. (Bogousky, 1905)

Additional data for the solubility of sulfur in several slightly polar solvents is given by Negisi, 1940.

### SOLUBILITY OF SULFUR IN RUBBER (Venable and Greene, 1922)

Thin strips of rubber stock, which had been compounded with 0 to 20 per cent of sulfur, were packed in flowers of sulfur and kept at desired temperatures until equilibrium was established. The samples

were then analyzed for free and combined sulfur. Equilibrium was approached from above and below, and was reached fairly quickly from below but from above, little of any of the excess sulfur migrated to the outside of the sheet. Consequently all the samples were given a preliminary heating to insure complete solution of the crystals before being placed in the pack. The results are given only in the form of curves and from these, the following approximate values were read. They show that the solubility increases as a "straight line function of the amount of combined sulfur up to a vulcanization coefficient of about 7."

Per cent combined Sulfur	Per cent free Sulfur at		
	55°	75°	95°
1.0	2.8	4.8	7.1
3.0	2.9	5.2	8.1
5.0	3.0	5.4	9.1
7.0	3.1	5.8	10.0

#### SOLUBILITY OF SULFUR IN RUBBER (Morris, 1932)

Mixtures of weighed amounts of pale crepe uncured rubber and sulfur were prepared in a laboratory mill and thin sheets of these were mounted between microscope slides and kept at controlled temperatures. Observation of these sheets by transmitted light with the aid of a microscope were made at a series of temperatures, and the point ascertained at which the solubility of the sulfur in the rubber is complete. The results are given in the form of a small diagram from which the following approximate values were read.

t°	Gms. S per 100 gms. rubber	t°	Gms. S per 100 gms. rubber
30	0.8	70	2.9
40	1.2	80	3.6
50	1.7	90	4.7
60	2.3	100	6.0

#### DISTRIBUTION OF SULFUR BETWEEN RUBBER AND AMYL ALCOHOL AND BETWEEN RUBBER AND n BUTYL ALCOHOL (Kelly and Ayers, 1924)

The determinations were made by two methods: (1) The sulfur was mixed with rubber and the mixture kept in contact with amyl alcohol. After attainment of equilibrium the sulfur in the amyl alcohol was determined. (2) The rubber was kept in contact with n butyl alcohol saturated with sulfur, and after attainment of equilibrium, the sulfur in the n butyl alcohol was determined.

The solubility of sulfur in n butyl alcohol at 30° was found to be 0.187 gm. S per 100 gms. alcohol. Assuming that the same ratio holds at saturation as that found by the distribution experiments, the solubility of sulfur in rubber was calculated to be  $(0.187 \times 5.4 = )$  1.01 gm. S per 100 gms. rubber at 30°.

A series of experiments made by suspending slabs of rubber, having different coefficients of vulcanization, in n butyl alcohol saturated

with sulfur, and stirring gently, gave results for the solubility which increased linearly with the coefficient of vulcanization up to a value of 17. This corresponds to the point where about 35 per cent of the double bonds of the rubber are saturated with sulfur. The results show that rubber dissolves but does not adsorb sulfur.

#### SOLUBILITY OF SULFUR IN RUBBER

The solubility and rate of diffusion of sulfur in natural crepe and in several synthetic rubbers was determined by Kemp, Malm, and Stiratelli, 1944 as a function of temperature and previous treatment. Data are also given by Kemp, Malm, and Winspear, 1940.

Data for the solubility of sulfur in styrene - butadiene copolymer is given by Williams, 1943.

Results are given for equilibrium in the following systems.

S + CHI <sub>3</sub> (Iodoform)	(1)

## SOLUBILITY OF SULFUR DIOXIDE IN WATER

The partial pressure of sulfur dioxide over its aqueous solutions has been determined by Benschlein and Simenson, 1940, Campbell and Maas, 1930, and Morgan and Maas, 1931 with results that do not agree with those of previous workers (for example those summarized by Sherwood, 1925). The best recent review is given by Plummer, 1950. The data of B. and S. overlap and extend those found in the International Critical Tables and have been put into equation and nomograph form by Davis, 1941. The approximate data listed below were read from curves drawn by B. and S. and M. and M.

- Partial pressure of SO<sub>2</sub> cm. Hg. -

## S SULFUR

### PARTIAL VAPOR PRESSURES OF AQUEOUS SOLUTIONS OF SULFUR DIOXIDE (Sherwood, 1925)

The author collected the available data on the partial vapor pressure of sulfur dioxide in water and from the plotted results constructed the following table. He assumed that the dissociation is constant at any particular temperature and that Henry's law applies to the undissociated solute. On the basis of this assumption it has been shown (Haslam, Her'shey and Keen, Ind. Eng. Chem, 16, 1225, 1924) that

$$S = H_p + \sqrt{KH_p} \text{ or } \frac{S}{\sqrt{p}} = H \sqrt{p} + \sqrt{KH},$$

when  $S$  = gms.  $\text{SO}_2$  dissolved in 1000 gms.  $\text{H}_2\text{O}$ ;  $p$  = partial pressure of  $\text{SO}_2$  in mm. Hg;  $H$  = Henry's law constant and  $K$  = dissociation constant of the  $\text{H}_2\text{SO}_3$ . The results of Schonfeld, Sims, Roozeboom, Lindner, Freeze, Smith and Parkhurst and Watts, were used.

Gms. $\text{SO}_2$ per 1000 gms. $\text{H}_2\text{O}$	Partial pressure of $\text{SO}_2$ in mm. Hg at

### SOLUBILITY OF SULFUR DIOXIDE IN WATER

The determinations of Hudson were made by bubbling the gas through the solution until saturation was reached. Special care was taken to obtain accurate results. Attention is called to the sources of error in the determinations of Schönfeld, 1855.

Freeze, 1920, gives results for the solubility of sulfur dioxide in water which are identical with those of Schönfeld, 1855.

Sp. Gr. of sat. solution at 0° = 1.061; at 10°, 1.055; at 20° = 1.024.

The results of Sims are discussed and recalculated by Fulda, 1909.

1 gm. H<sub>2</sub>O dissolves 0.0909 gm. SO<sub>2</sub> = 34.73 cc. (measured at 25°) at 25° and 760 mm. pressure. (Walden and Centnerszwer, 1902-03.)

Data for the solubility of sulfur dioxide in water at atmospheric pressure from 0° to 100° is given by Oman, 1924.

## FREEZING-POINT DATA FOR THE SYSTEM SULFUR DIOXIDE - WATER

(Results of Baume and Tykociner, 1914)

At the temperature +12.1° and extending over the range of concentration 11 to 95.1 mols. per cent SO<sub>2</sub> a second phase rich in SO<sub>2</sub> separates. This crystallizes at -74° and the diagram is consequently composed of two lines parallel to the axis of concentration, the one at the +12.1° level corresponding to the SO<sub>2</sub> hydrate, and the other at the -74° level, to the SO<sub>2</sub> rich phase. The diagram is terminated by a very

short branch rising from  $-74^{\circ}$  to the temperature of solidification of pure  $\text{SO}_2$  ( $-72.3^{\circ}$ ).

t° of Freezing	Mols. $\text{SO}_2$ per 100 Mols. $\text{SO}_2 + \text{H}_2\text{O}$		Solid Phase	t° of Freezing	Mols. $\text{SO}_2$ per 100 Mols. $\text{SO}_2 + \text{H}_2\text{O}$		Solid Phase

\*Eutectic

More recent determinations of the equilibrium in the system  $\text{SO}_2 + \text{H}_2\text{O}$ , made by the synthetic method, are described by Terres and Ruhl, 1934. A hitherto unrecognized second modification of solid  $\text{SO}_2$  was obtained. Its formation is apparently caused by traces of  $\text{H}_2\text{O}$ . Its melting point is  $-63.5^{\circ}$  instead of  $-71^{\circ}$  the m.pt. of the ordinary form of solid  $\text{SO}_2$ . The numerical results of the determinations are given only in the complete report of the work published *Beihefte zu den Zeitschriften des Vereins deutscher Chemiker* No. 8, 1934, Verlag Chemie Berlin W35 Cornelius Str. 3.

For data near the critical point in the system  $\text{SO}_2 - \text{H}_2\text{O}$  see Butcher and Hanson, 1957.

(Results of Miles and Carson, 1946 in Sulfuric Acid and Oleum Solutions)

The authors plotted their data and drew curves which show minima or inflections at compositions corresponding to  $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ ,  $\text{H}_2\text{SO}_4$ , and  $\text{H}_2\text{SO}_4 \cdot \text{SO}_3$ , but the accuracy of the determinations seems to justify only the drawing of a smooth curve having a single minimum near 70% total  $\text{SO}_3$  [ $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ ]. Results are given for a partial pressure of  $\text{SO}_2 = 760$  mm. and were read from the smooth curve.

The author also gives a series of determinations in which a mixture of  $\text{SO}_2 + \text{CO}_2$  is used for saturating the solutions, thus changing the concentration of the  $\text{SO}_2$  and yielding results for certain partial pressures of this gas.

Additional data for the solubility of sulfur dioxide in aqueous salt solutions are given by Walden and Centnerszwer (1902-03) but these

authors present their results in terms of the difference between the amount of  $\text{SO}_2$  dissolved in water and in the aqueous solution. The exact manner in which these calculations were made is not clearly explained.

The amounts of free and combined SO<sub>2</sub> in solutions saturated with SO<sub>2</sub> and MgSO<sub>4</sub>·6H<sub>2</sub>O at 15° and 25° up to one atmosphere total pressure are given by Conrad and Brice, 1948.

In addition to the above results given by Smith and Parkhurst, 1922. These authors also determined the solubility of sulfur dioxide in aqueous suspensions of calcium and magnesium hydroxides.

The solubility of SO<sub>2</sub> in dilute NH<sub>4</sub>HSO<sub>3</sub> solutions at 15, 20, 25 and 30° was measured by Domansky and Rendos, 1957.

Data for the solubility of sulfur dioxide in calcium bisulfite solutions is given by White, Vivian, and Whitney (1948), Schmied (1955), Conrad and Bueschlein (1937), and Euckell (1925). For an extensive review see Dickens and Plummer (1957).

Euckell (1925) gives data for the solubility in water, sulfuric acid, and sodium sulfate solutions from 40° to 90°. Jager (1957) gives results in aqueous ZnSO<sub>4</sub> solutions from 20 - 100°.

Data for the solubility of sulfur dioxide in disodium hydrogen phosphate solutions is given by Luchinskii and Tavorovakaya, 1940.

## S SULFUR

### SOLUBILITY OF SULFUR DIOXIDE IN SEVERAL SOLVENTS (Lloyd, 1918)

The dry, air free,  $\text{SO}_2$  was passed through the solvent until saturation was reached and 5 cc. (usually) of the saturated solution were mixed with a large volume of water and titrated with standardized iodine solution.

t°	Gms. $\text{SO}_2$ per Liter of Saturated Solution in:				
	Benzene	Nitrobenzene	Toluene	o Nitrotoluene	Acetic Anhydride
- 5	-	-	-	-	196
0	-	-	-	-	148 (d = 1.22)
+ 5	-	-	-	-	136
10	-	-	-	-	122
15	-	311.4	-	290.8	114
20	-	267.4	217.5	236	106
25	-	227.9	170.4	192.2	99
30	127.5	190	124.4	160.7	90
40	82.9	132	93.6	118.5	-
50	60.3	98.7	77.2	87.2	-
60	34	78.6	54.7	68.8	-

### SOLUBILITY OF SULFUR DIOXIDE IN CAMPHOR AND TERPENE SOLUTIONS AT 20° (Weissenberger and Hadwiger, 1927)

Solvent	Ml. $\text{SO}_2$ absorbed per ml. of Solvent
Cyclohexanone	22.80
10 Wt. % Camphor in Cyclohexanone	15.20
20 Wt. % Camphor in Cyclohexanone	14.70
m-Methylcyclohexanol	16.72
10 Wt. % Camphor in m-Methylcyclohexanol	17.30
20 Wt. % Camphor in m-Methylcyclohexanol	11.00
Decahydronaphthalin	7.50
Hydroterpine (Density = 0.883)	14.5
Turpentine	8.3
10 Wt. % Camphor in Tetrahydronaphthalin	6.95

At 0°, 725 mm 0.880 gms.  $\text{SO}_2$  dissolve in 1 gm camphor (Schulze, 1881).

### SOLUBILITY OF SULFUR DIOXIDE IN SOLAR OIL (PETROLEUM) (Avdeeva and Pitelina, 1947)

See note Vol. I, p. 494.

t°	Gms. $\text{SO}_2$ per Liter	Moles $\text{SO}_2$ per Liter	t°	Gms. $\text{SO}_2$ per Liter	Moles $\text{SO}_2$ per Liter
10	40.60	0.635	60	14.68	0.229
14	38.10	.596	110	6.44	.105
30	23.40	.366	115	6.00	.094

The miscibility gap in each of the following ternary liquid systems has been determined by Satterfield, Powell and Oster, Jr., 1955.

SO<sub>2</sub> + n-hexane + benzene at -20° F  
 SO<sub>2</sub> + n-butane + benzene at -20° F  
 SO<sub>2</sub> + n-heptane + benzene at 0°, -20°, -35° F  
 SO<sub>2</sub> + n-decane + benzene at -20° F  
 SO<sub>2</sub> + cyclohexane + benzene at -20° F  
 SO<sub>2</sub> + n-heptane + toluene at -20° F  
 SO<sub>2</sub> + n-decane + sec-butylbenzene at -20° F  
 SO<sub>2</sub> + n-decane + mixed xylenes at -20° F

#### RECIPROCAL SOLUBILITY OF LIQUID SULFUR DIOXIDE AND TOLUENE (Zerner, Weisz and Opaliski, 1922)

0

The accurately weighed mixtures were sealed in tubes of resistance glass and the temperatures determined at which clouding and clearing occurred. The liquid SO<sub>2</sub> contained 0.56% H<sub>2</sub>O and 0.67% oily residue.

t° of clouding	17.0	21.0	21.0	13.5	7.0	About -25.0°
% SO <sub>2</sub> in mixture	21.64	24.21	34.56	54.50	72.07	92.95

The correctness of the above results is questioned by Fontein, 1923, who points out that the observed clouding is due to the water content of the SO<sub>2</sub> used. A repetition of the determinations showed Zerner Weisz and Opulski that both toluene and tetralin are completely miscible with sulfur dioxide.

405 vol. of SO<sub>2</sub> (0°, 1 atm) dissolve in 1 vol. of dimethylformamide at 25° C. (Dupont, 1955.)

0.323 gms SO<sub>2</sub> dissolve in 1 gm SO<sub>2</sub>Cl<sub>2</sub> at 0°, 725 mm. (Schulze, 1881.)

0.821 gms SO<sub>2</sub> dissolve in 1 gm formic acid at 0°, 725 mm. (Schulze, 1881.)

#### SOLUBILITY OF SO<sub>2</sub> IN DIMETHYL SULFOXIDE (CH<sub>3</sub>)<sub>2</sub>SO (Smedslund, 1950)

t°	Wt. % SO <sub>2</sub> in sat. sol. in (CH <sub>3</sub> ) <sub>2</sub> SO	t°	Wt. % SO <sub>2</sub> in sat. sol. in (CH <sub>3</sub> ) <sub>2</sub> SO contg. 10% H <sub>2</sub> O
18	60.13	19	54.3
20	59.12(50- vol/vol D.M.S.)	77	22.1
100	17.9	135	6.0
161	3.2	147	2.5

A 1:1 mixture of butadiene and isoprene sulfones dissolves 37% of its weight of SO<sub>2</sub> at 28° and 95% at 10°. (Grummitt and Ardis, 1946.)

SOLUBILITY OF SULFUR DIOXIDE IN RUBBER  
(Venable and Fuwa, 1922)

100 cc. of rubber saturated with sulfur dioxide at 21° dissolve 1950 cc. SO<sub>2</sub> (0° and 760 mm.). The determination was made by pumping out the gas with a Topler pump and measuring it over mercury. In the same way 100 cc. of H<sub>2</sub>O at 21° was found to dissolve 3,661.7 cc. SO<sub>2</sub> (0° and 760 mm.). The authors also give results for the effect of pressure and temperature upon the solubility of sulfur dioxide in rubber.

Vapor pressure measurements between -20° and +30° are given by Foote and Fleischer, 1934, for the systems composed of SO<sub>2</sub> and each of the following compounds:

0

* Aniline	Di phenyl amine	Di phenyl ether
* Methyl aniline	* Toluidine	α Naphthol
* Ethyl aniline	Naphthalene	β Naphthol
Di ethyl aniline	Di phenyl	Ethylene glycole

Solid addition compounds were formed with those marked with an asterisk.

Data for the reciprocal solubility of SO<sub>2</sub> (also of air, CO<sub>2</sub>, NH<sub>3</sub>, and HCl) and the vapors of ether, methyl alcohol, acetone and chloroform, as determined by measuring at 25° the change in pressure produced by adding a weighed amount of the volatile liquid to a given volume of SO<sub>2</sub> are given by MacFarlane and Wright, 1934.

Freezing-point data are given for:

SO <sub>2</sub> + SiCl <sub>4</sub>	(Bond and Stephens, 1929)
SO <sub>2</sub> + SnBr <sub>4</sub>	(Bond and Beach, 1926)
SO <sub>2</sub> + SnCl <sub>4</sub>	(Bond and Beach, 1926)
SO <sub>2</sub> + SnI <sub>4</sub>	(Beach and Bond, 1925)
SO <sub>2</sub> + TiBr <sub>4</sub>	(Bond and Crone, 1934)
SO <sub>2</sub> + GeCl <sub>4</sub>	(Bond and Crone, 1934)
SO <sub>2</sub> + CCl <sub>4</sub>	(Bond and Beach, 1926; Beach and Bond, 1925)
SO <sub>2</sub> + Methyl Alcohol	(Baume and Pamfil, 1914)
SO <sub>2</sub> + Methyl alcohol + Propionic Acid	(Baume et al., 1914)
SO <sub>2</sub> + Methyl Ester	(Baume et al., 1914; Baume, 1914)
SO <sub>2</sub> + Benzene	(Seyer and Peck, 1930; DeCarli, 1926, 1926a)
SO <sub>2</sub> + Cyclohexane	(Seyer and Dunbar, 1922; Seyer and King, 1933)
SO <sub>2</sub> + Cyclohexene	(Seyer and King, 1933)
SO <sub>2</sub> + Cyclohexadiene	(Seyer and King, 1933)
SO <sub>2</sub> + n Hexane	(Seyer and Todd, 1931)
SO <sub>2</sub> + n Butane	(Seyer and Todd, 1931)
SO <sub>2</sub> + Pyridine	(Hoffman and Van der Werf, 1946)
SO <sub>2</sub> + α-Picoline	(Hoffman and Van der Werf, 1946)
SO <sub>2</sub> + β-Picoline	(Hoffman and Van der Werf, 1946)
SO <sub>2</sub> + γ-Picoline	(Hoffman and Van der Werf, 1946)
SO <sub>2</sub> + Acetic Acid	(Scheub and McCrosky, 1944)
SO <sub>2</sub> + Ethylene Oxide	(Albertson and Fernelius, 1943)
SO <sub>2</sub> + Dioxane	(Albertson and Fernelius, 1943)
SO <sub>2</sub> + Anisole	(Albertson and Fernelius, 1943)
SO <sub>2</sub> + Acetone	(Albertson and Fernelius, 1943)
SO <sub>2</sub> + Diethylsulfide	(Albertson and Fernelius, 1943)
SO <sub>2</sub> + Methylaniline	(Albertson and Fernelius, 1943)

(Cont.)

## Freezing-point data, continued:

SO <sub>2</sub> + Cetene	(Seyer and Ball, 1926)
SO <sub>2</sub> + Cetyl alcohol	(Seyer and Ball, 1926)
SO <sub>2</sub> + n Decane	(Seyer and Todd, 1931)
SO <sub>2</sub> + Octane	(Seyer and Todd, 1931; Seyer and Gallanger, 1926)
SO <sub>2</sub> + n Dodecane	(Seyer and Todd, 1931)
SO <sub>2</sub> + n Tetra decane	(Seyer and Todd, 1931)
SO <sub>2</sub> + n Dotria contane	(Seyer and Todd, 1931)
SO <sub>2</sub> + Caprylene	(Seyer and Hodnett, 1936)
SO <sub>2</sub> + Decalin (cis and trans Deca hydronaphthalene)	(Seyer and Cornett, 1937)
SO <sub>2</sub> + Styrene	(Marvel and Glavis, 1938)
SO <sub>2</sub> + 10-Hendecenoic Acid	(Marvel and Glavis, 1938)
SO <sub>2</sub> + 1-Pentane	(Marvel and Glavis, 1938)
SO <sub>2</sub> + Vinyle chloride	(Marvel and Glavis, 1938)
SO <sub>2</sub> + Camphor	(Bellucci and Grassi, 1913)
SO <sub>2</sub> + Toluene	(DeCarli, 1926, 1926a)
SO <sub>2</sub> + Tetraline	(DeCarli, 1926, 1926a)
SO <sub>2</sub> + Phenol	(Nikitin and Kovalskaya, 1952)
SO <sub>2</sub> + Formamide	(Terres and Doerges, 1956)
SO <sub>2</sub> + Dimethyl Formamide	(Terres and Doerges, 1956)
SO <sub>2</sub> + Ethyl Acetate	(Terres and Doerges, 1956)
SO <sub>2</sub> + n-Propyl Acetate	(Terres and Doerges, 1956)
SO <sub>2</sub> + 2, 3 Lutidine	(Hoffman and Van der Werf, 1948)
SO <sub>2</sub> + 2, 4 Lutidine	(Hoffman and Van der Werf, 1948)
SO <sub>2</sub> + 2, 6 Lutidine	(Hoffman and Van der Werf, 1948)
SO <sub>2</sub> + n-Hexane	(Seyer and Gill, 1924)
SO <sub>2</sub> + Cetane	(Seyer and Hugget, 1924)
SO <sub>2</sub> + many aromatic compounds	(Terres and Doerges, 1956)

Data for the solubility of sulfur dioxide in liquid magnesium are given by Schneider and Each, 1940.

SULFUR TRIOXIDE SO<sub>3</sub>

(Also see H<sub>2</sub>SO<sub>4</sub>.)

Data for equilibrium in the system SO<sub>3</sub> + H<sub>2</sub>O + H<sub>2</sub>SO<sub>4</sub>, determined by the freezing-point method, are given by Moles and Carlota, 1936.

Data for the solubility of SO<sub>3</sub> in H<sub>2</sub>SO<sub>4</sub> - HNO<sub>3</sub> mixtures are given by Gel'fman, 1950 and Revallier, 1955.

Freezing points in the system SO<sub>3</sub> - D<sub>2</sub>O and in solutions containing NaDSO<sub>4</sub>, KDSO<sub>4</sub>, etc., are given by Flowers, Gillespie, Oubridge and Solomons, 1958.

## Sb STIBIUM

## Sb ANTIMONY

Fusion-point data are given for:

Sb + I	(Jaeger and Dornbosch, 1912)
Sb + I + As	(Quercigh, 1912)
Sb + S	(Jaeger and Dornbosch, 1912)
Sb + Zn + Pb	(Tammann and Schaftmeister, 1924)

In the case of each of the above xylenes the compound existing between the first and second eutectic consists of equimolecular amounts of SbBr<sub>3</sub> and xylene.

1-1 = compound of equimolecular amounts of the two constituents in each case.

2-1 = compound of 2 molecules of SbBr<sub>3</sub> with 1 molecule of the other constituent.

m = melting point

e = eutectic

t = transition point

THE SYSTEM  $\text{SbBr}_3 - \text{Br}_2$   
(Pusin and Makur, 1938)

Read from the graph drawn by the authors.

8.3	68.2	16.80	857.6				

100 gms. sat. sol. of  $\text{SbCl}_3$  in  $\text{H}_2\text{O}$  contain 90.90 gms.  $\text{SbCl}_3$  at 25°.  
100 gms. sat. sol. of  $\text{SbCl}_3$  in 10.55% HCl contain 90.07 gms.  $\text{SbCl}_3$  at 25°. (Miyake, 1924, 1925.)

Data for the system  $\text{SbCl}_3 + \text{KCl} + \text{H}_2\text{O}$  are given. The double salts  $2\text{KClSbCl}_3$  and  $7\text{KCl}_3\text{SbCl}_3$  were found but no mixed crystals as mentioned by Jordis, 1903.

Data for the extraction of  $\text{SbCl}_3$  from aqueous HCl solutions containing  $\text{NH}_4\text{SCN}$  are given by Bock, 1951.

DISTRIBUTION OF  $\text{SbCl}_3$  BETWEEN AQUEOUS  $\text{HCl}$  AND ETHER  
(Mylius, 1911)

1 gm. Sb as  $\text{SbCl}_3$ , dissolved in 100 cc. aqueous  $\text{HCl}$ , was shaken with 100 cc ethyl ether at room temperature.

% of Conc. of $\text{HCl}$	% of Total Sb in Ether Layer

#### ANTIMONY PENTACHLORIDE SbCl<sub>5</sub>

Cl

##### DISTRIBUTION BETWEEN AQUEOUS HCl AND ETHYL ETHER (Mylius, 1911)

1 gm. Sb as SbCl<sub>5</sub>, dissolved in 100 cc. aqueous HCl, was shaken with 100 cc. ethyl ether at room temperature.

% Conc. of HCl	% of Total Sb in Ether Layer
20	81
15	22
10	6
5	2.5
1	trace

100 gms. of a sat. solution of antimony pentachloride (SbCl<sub>5</sub>) in selenium oxychloride (SeOCl<sub>2</sub>) contain 38.64 gms. SbCl<sub>5</sub> at 25°. (Wise, 1923.)

1 mole % SbCl<sub>5</sub> dissolves in iodine monochloride (ICl). (Gutmann, 1950.)

Data for the freezing-points of mixtures of antimony pentachloride and antimony pentafluoride are given by Ruff (1909).

ANTIMONY OXYCHLORIDE  $\text{Sb}_4\text{O}_5\text{Cl}_2$ SOLUBILITY IN AQUEOUS SOLUTIONS OF HYDROCHLORIC ACID AT 25°  
(Lea and Wood, 1924)

Hydrated antimonious oxide was added in excess to solutions of pure HCl of varying concentrations and the mixtures kept in a thermostat for two months. They were shaken from time to time by hand. Portions were removed for analysis and after another month other portions were removed for a duplicate analysis. The results agreed satisfactorily, thus indicating that equilibrium had been reached. The results gave a smooth curve, thus showing the absence of a transition point. The solid phase gradually took on a crystalline appearance and on analysis corresponded to  $\text{Sb}_4\text{O}_5\text{Cl}_2$ .

Melting points in the system  $\text{Sb}_2\text{O}_3$  -  $\text{Sb}_2\text{S}_3$  are given by Quercigh, 1912, and by Koster and Braumann, 1951.

## Sb STIBIUM

### ANTIMONY TRISULFIDE $Sb_2S_3$

Kapustinsky (1940) calculated the solubility product at 25° on the basis of thermochemical data to be  $2.9 \times 10^{-59}$ . The calculated solubility in aqueous solutions is thus:

pH:	3	5	7	9	11
Moles $Sb_2S_3$ per liter:	$3.3 \times 10^{-2}$	$1.3 \times 10^{-4}$	$8.2 \times 10^{-7}$	$3.5 \times 10^{-8}$	$2.2 \times 10^{-9}$

1000 cc water dissolve 0.00175 gm.  $Sb_2S_3$  at 18°. (Weigel, 1907.)

#### SOLUBILITY OF ANTIMONY TRI SULFIDE IN AQUEOUS SOLUTIONS OF AMMONIA (Epik, 1932)

The determinations were made by warming mixtures of sulfide and aqueous ammonia of different concentrations for five minutes over a Bunsen burner. The solutions thus obtained were analyzed for antimony and residual ammonia.

Percent concentration of $NH_3$ in solvent		Gms. $Sb_2S_3$ dissolved per 100 cc solvent
at beginning	at end	
1.0	0.88	0.127
2.0	1.7	0.206
5.0	4.0	0.420
10.0	7.4	0.730
15.0	9.2	0.870
25.0	13.4	1.280

The effect of time of heating and variation in excess of sulfide were studied. The gms. of sulfide per 100 cc of solvent was found to increase from 0.58 to 0.73 when the amount of sulfide per 1 gm. of  $NH_3$  in the original solution varied from 0.05 to 0.15.

Fusion-point data are given for:

$Sb_2S_3 + CuS$	(Parravano and Cesaris, 1912)
$Sb_2S_3 + SnS$	(Parravano and Cesaris, 1912)
$Sb_2S_3 + Ag_2S$	(Jaeger and Van Klooster, 1912; Kuroso, 1919;
$Sb_2S_3 + PbS$	Pelabon, 1913; Jitsuka, 1919)
$Sb_2S_3 + BiS$	(Takahashi, 1919)

Scandium sulfuric acid double sulfate,  $\text{Sc}_2(\text{SO}_4)_3 \cdot 3\text{H}_2\text{SO}_4$ : 100 gms. sat. sol. in conc.  $\text{H}_2\text{SO}_4$  of  $\bar{d} = 1.6$  contain 0.8616 gm. of the double salt. (Wirth, 1914.)

Se SELENIUM

Se SELENIUM

SOLUBILITY IN ALKALIS

(Calcagni, 1923)

100 cc. of aq. 66% KOH solution dissolve 9.19 gms. Se. This corresponds to an atomic ratio of 39.15 gm. atoms K:14.91 gms. atoms Se, which shows that not all of the selenium is in the form of selenide.

100 cc. of aq. 66% NaOH solution dissolve 2.45 gms. Se.

100 cc. of sat. aq. Ba(OH)<sub>2</sub> solution dissolve 2.65 gms. Se after being kept several days at 80°.

SOLUBILITY OF SELENIUM IN CARBON DISULFIDE

(Moles and Jimeno, 1915)

(Also see the earlier data of Marc, 1906, 1907, below.)

Carefully prepared amorphous red selenium was used. The saturated solutions were analyzed by evaporating at ordinary temperature and weighing the residue after heating to 110°. The solubility of selenium varies with the time which elapses after its preparation and with the time of exposure to light. Amorphous selenium in contact with carbon disulfide is transformed to crystalline selenium. The variations in solubility are probably due to this transformation. It is necessary to admit the existence of many varieties of red crystalline selenium with different solubilities. These varieties owe their origin to the action of the solvent or of light and may be identical with the two monoclinic modifications studied by Muthmann. Some of the solubility results obtained by the authors are as follows:

t°	Gms. Se per 100 gms. Se+CS <sub>2</sub>	Conditions of the determination
?	0.0573	Solubility 1 hour after preparation of sample
?	0.0475	Solubility 24 hours after preparation of sample
?	0.0190	Solubility 1436 hours after preparation of sample
3	0.00191	Solution prepared in the dark: 3 hours
12	0.00247	Solution prepared in the dark: 3 hours
12	0.00662	Solution prepared in the dark: 72 hours
9	0.0251	Same solution after 48 hours exposure to sunlight
44	0.1586	Solution in boiling CS <sub>2</sub>
0	0.0184	The above solution cooled for 20 hours

100 gms. selenium monochloride saturated with selenium by shaking in a thermostat at 25° for a very long time contain 9.73 gms. Se. (Lenher and Kao, 1926.)

SOLUBILITY IN CARBON DISULFIDE  
(Marc, 1906)

C

100 cc. CS<sub>2</sub> dissolve 0.065 gm. amorphous Se at room temperature. Se which is heated to 180° for 6 - 7 hours is insoluble in CS<sub>2</sub>. Se crystallized from the melt at 200° is insoluble in CS<sub>2</sub>. Se heated once quickly to 140° is very slightly soluble in CS<sub>2</sub>.

100 cc. CS<sub>2</sub> dissolve at the boiling-point 3 - 3.4 mgs. Se which has been heated to 140° for 1 hr.

100 cc. CS<sub>2</sub> dissolve at the boiling-point 2 mgs. Se which has been heated to 195° for 2 days. (Marc, 1907.)

The surface tension and density of solutions of selenium and sulfur in carbon disulfide were accurately determined by Kapustinsky and Golutvin, 1947.

SOLUBILITY OF MIXED CRYSTALS OF SELENIUM AND SULFUR IN  
CARBON DISULFIDE AT 25°  
(Ringer, 1902)

## Si SILICON

SOLUBILITY IN LEAD, IN ZINC AND IN SILVER  
(Moissan and Siemens, 1904)

In Lead		In Zinc		In Silver	
t°	Gms. Si per 100 Gms. Lead	t°	Gms. Si per 100 Gms. Zinc	t°	Gms. Si per 100 Gms. Silver
1250	0.024	600	0.06	970	9.22 (58.02)
1330	0.070	650	0.15	1150	14.89 (27.66)
1400	0.150	730	0.57	1250	19.26 (19)
1450	0.210	800	0.92	1470	41.46 (16)
1550	0.780	850	1.62		

The silicon which crystallized from the saturated solution in silver was found to be incompletely soluble in HF. The figures in parentheses show the percentage soluble in HF in each case.

Data for the solubility of silicon in liquid gallium between 300°--1420° are given by Keck and Broder, 1953.

## Br SILICON TETRABROMIDE $SiBr_4$

MELTING POINTS OF SILICON TETRABROMIDE - DIOXANE SOLUTIONS  
(Kennard and McCusker, 1948)

## Si SILICON

Melting point data are given for the following systems:

$\text{SiCl}_4$ + Dioxane	(Kennard and McCusker, 1948)
$\text{SiCl}_4$ + Anisole	(Sisler, et al., 1948; Sisler and Cory, 1947)
$\text{SiCl}_4$ + Phenetole	(Sisler, et al., 1948)
$\text{SiCl}_4$ + Methyl-m-Cresyl Ether	(Sisler, et al., 1948)
$\text{SiCl}_4$ + Diphenyl Ether	(Sisler and Cory, 1947)
$\text{SiCl}_4$ + Diethyl Ether	(Sisler and Mattair, 1948; Sisler, Batey, Pfahler, and Mattier, 1948)
$\text{SiCl}_4$ + Tetrahydrofuran	(Sisler, Batey, Pfahler, and Mattier, 1948)
$\text{SiCl}_4$ + Azobenzene	(Pushin, 1948a)
$\text{SiCl}_4$ + Naphthalene	(Pushin, 1948a)
$\text{SiCl}_4$ + SiI	(Raeder, 1933)
$\text{SiCl}_4$ + $\text{TiCl}_4$	(Nasu, 1933, 1934)
$\text{SiCl}_4$ + $\text{SnCl}_4$	(Sackmann, Schaaf and Arnold, 1958)
Cl $\text{SiCl}_4$ + $\text{TiCl}_4$	(Sackmann, Schaaf and Arnold, 1958)
$\text{SiCl}_4$ + $\text{CCl}_4$	(Sackmann, 1955)

### SILICON METHYL CHLORIDES $\text{SiCl}(\text{CH}_3)_3$ $\text{SiCl}_2(\text{CH}_3)_2$ $\text{SiCl}_3(\text{CH}_3)$

Melting points in the systems  $\text{SiCl}_4$  - diethyl ether,  $\text{SiCl}(\text{CH}_3)_3$  - diethyl ether,  $\text{SiCl}_2(\text{CH}_3)_2$  - diethyl ether and  $\text{SiCl}_3(\text{CH}_3)$  - diethyl ether are given by Sisler and Mattair, 1948.

### TRICHLOROSILANE $\text{SiHCl}_3$

Melting points are given for the systems  $\text{SiHCl}_3$  +  $(\text{C}_2\text{H}_5)_2\text{O}$  and  $\text{SiHCl}_3$  + tetrahydrofuran by Sisler, Schilling and Groves, 1951.

## F SILICON TETRAFLUORIDE $\text{SiF}_4$

SOLUBILITY IN AQUEOUS HYDROFLUORIC ACID SOLUTIONS AT 15°

SILICON POTASSIUM HEXAFLUORIDE SiK<sub>2</sub>F<sub>6</sub>

K

(See also potassium fluosilicate)

100 cc. sat. sol. of silicon potassium hexafluoride in water contain 0.00544 gm. SiK<sub>2</sub>F<sub>6</sub> at 17°. (von Hevesy, Christiansen and Berglund, 1925.)

## Si SILICON

### I SILICON IODIDES $\text{Si}_2\text{I}_6$ , $\text{SiI}_4$

SOLUBILITY IN CARBON DISULFIDE  
(Friedel and Lachburg, 1869; Friedel, 1869)

100 gms.  $\text{CS}_2$  dissolve 19 gms.  $\text{Si}_2\text{I}_6$  at 19°.  
100 gms.  $\text{CS}_2$  dissolve 26 gms.  $\text{Si}_2\text{I}_6$  at 27°.  
100 gms.  $\text{CS}_2$  dissolve 2.2 gms.  $\text{SiI}_4$  at 27°.

### O SILICON DIOXIDE $\text{SiO}_2$

#### SOLUBILITY OF AMORPHOUS SILICA IN WATER

The results of various authors are in very good agreement from 0° to 200°. Alexander, Heston and Iler, 1954 plotted their data and those of Struckman (1885), Gardner, Szychalski (1938), Hitchen (1935) Lenher and Merrill (1917), Jephcott and Johnson (1950). The results of Morachevskii and Piryutko (1956) also agree. The degree of hydration and the conditions of preheating affect the rate of attainment of equilibrium. The following values were read from the average plot.

t°	Wt. % $\text{SiO}_2$ in sat. sol.	t°	Wt. % $\text{SiO}_2$ in sat. sol.
0	0.003	100	0.043
25	0.012	125	0.053
50	0.023	150	0.062
75	0.033	175	0.072
		200	0.081

#### SOLUBILITY OF $\text{SiO}_2$ AT VARIOUS pH (Alexander, Heston and Iler, 1954)

(HCl or NaOH added; also see tables following.)

pH	Wt. % $\text{SiO}_2$ in sat. sol.	pH	Wt. % $\text{SiO}_2$ in sat. sol.
1	0.015	7	0.011
2	0.016	8	0.012
3	0.015	9	0.015
4	0.014	10	0.035
6	0.011	11	0.33

#### SOLUBILITY OF SILICA IN AQUEOUS SOLUTIONS OF ACIDS (Lenher and Merrill, 1917)

A platinum bottle and stirrer were used. The silica was prepared by adding silicon tetrachloride to water. The gel thus formed was washed until free of HCl and dried between filter papers. Conductivity water was used and equilibrium was reached within 24 hours. The saturated solution was evaporated to dryness in a platinum dish. The residue was

weighed and the silica volatilized with  $\text{HF}$  +  $\text{H}_2\text{SO}_4$ . The difference was considered to show "the amount of silica which had changed from an un-filterable to a filterable state of division."

<u>Results for Aqueous HCl</u>				<u>Results for Aqueous</u>	
<u>At 25°</u>		<u>At 90°</u>		<u>H<sub>2</sub>SO<sub>4</sub> at 90°</u>	
% HCl	Gm. SiO <sub>2</sub> per 50 cc Sol.	% HCl	Gm. SiO <sub>2</sub> per 50 cc Sol.	% H <sub>2</sub> SO <sub>4</sub>	Gm. SiO <sub>2</sub> per 50 cc Sol.
0	0.0080	0	0.0213	3.9	0.0211
3	0.00665	2	0.0198	7.3	0.0186
6.3	0.00465	3	0.0186	15.6	0.0112
11.1	0.00245	5.4	0.0152	25.4	0.0058
18.9	0.0008	7.6	0.0115	36	0.0034
25.1	0.0006	10	0.0091	46.9	0.0013
34.6	0.0003	13.6	0.0056	55.6	0.0005
		18.6	0.0029	71	0.0004

At 90°, a slow current of  $\text{CO}_2$  through the solutions did not affect the results. Ignited silica reaches equilibrium very slowly as compared with silica gel. The true solubility of ignited silica is probably the same as that of gelatinous silica.

Data for the solubility of  $\text{SiO}_2$  in aqueous  $\text{H}_3\text{PO}_4$  at 50° and 90° are given by Sveshnikova and Danilova, 1957.

#### SOLUBILITY OF SILICA HYDRATE IN 3.0 NORMAL AMMONIA AT 18° (Schwarz, 1916)

The hydrate was prepared by conducting silicon fluoride in water. It was washed with water and dried at 150°. It contained 9.04%  $\text{H}_2\text{O}$ . About 0.12 gm. quantities were shaken with 25 cc. portions of 3.0 n ammonia and allowed to stand. The amount dissolved per 25 cc. increased with the time of shaking from 0.0144 gm. after 4 hours to 0.0522 gm. after 228 hours. The curve drawn from the results showed that the maximum solubility was reached in about 200 hours. The solubility varies with the water content and modification of the silica. No ammonium silicate was formed.

Data for the rate of solubility of silica in aqueous  $\text{NaOH}$  are given by Holt and King, 1955. Rates of solution in aqueous  $\text{Na}_2\text{CO}_3$  and aqueous  $\text{NaHCO}_3$  at 20° are given by Tregan. For other data in aqueous  $\text{NaOH}$ ,  $\text{KOH}$  and quaternary hydroxides see Merrill and Spencer, 1951 and Correns, 1941.

Data for the solubility of  $\text{SiO}_2$  in  $\text{NH}_4\text{F}$  solutions is given by Dixon, 1946.

# Si SILICON

## SOLUBILITY OF SILICA IN WATER AT HIGH TEMPERATURES AND PRESSURES (Kennedy, 1950)

Results in agreement with these are given by Morey and Hesselgesser, 1951, by Wyart and Sabatier, 1955, and by Franke, 1950, Schloemer, 1952.

t°	Gms. SiO <sub>2</sub> per 100 gms. sat. sol.		t°	Gms. SiO <sub>2</sub> per 100 gms. sat. sol.	
	Quartz	Amorphous		Quartz	Amorphous

150	0.003	0.062	350	0.070	0.230
200	0.024	0.090	374	0.023	-
250	0.049	0.126			

## TWO PHASE SOLUBILITY OF QUARTZ IN STEAM

This system has been extensively studied by Kennedy (1950), as shown in the following diagram.

## Results of Khitarov, 1956 at higher pressures:

Pressure, bars	Wt. % SiO <sub>2</sub> in saturated solution in steam			
	400°	450°	500°	600°
1000	-	-	0.19 - 0.26	0.30
2000	0.22 - 0.23	-	-	-
3000	0.26	0.43	-	1.20
4000	0.30	-	-	-

For additional data at high temperatures and pressures see Styrikovich, Khaibullin and Tskhviraashvili, 1955 (up to 180 atm.); Mosebach, 1955 (review and thermodynamics); Wyart and Sabatier, 1954 (up to 400°, 480 bars); Morey, 1953 (400 - 600°, up to 30,000 p.s.i.); Gillingham, 1948; Morey and Hesselgesser, 1951 (up to 500°, 15,000 p.s.i.); Mosebach, 1956; Jasmund 1953. See also Tuttle and England, 1955; Wasserburg, 1958, 1958a, Wood, 1958.

The effect of particle size on the solubility of amorphous SiO<sub>2</sub> was determined by Alexander, 1957. The effect of particle size and formation of polysilicic acid is discussed by Baumann, 1955. Stober, 1956 and Greenberg and Price, 1957 discuss the mechanism of dissolution in terms of polyacids. Holt and King, 1955 discuss leaching of surface layers of SiO<sub>2</sub>.

SOLUBILITY OF QUARTZ IN ALKALINE SOLUTIONS  
(Friedman, 1948) (Tuttle and Friedman, 1948)

Gms. SiO<sub>2</sub> per liter of Aqueous NaOH or Na<sub>2</sub>CO<sub>3</sub> Solution

Solvent % Na <sub>2</sub> O	300°		350°		400°		450°	
	NaOH	Na <sub>2</sub> CO <sub>3</sub>	NaOH	Na <sub>2</sub> CO <sub>3</sub>	NaOH	Na <sub>2</sub> CO <sub>3</sub>	NaOH	Na <sub>2</sub> CO <sub>3</sub>
1	20	5	25	13	35	22	35	24
5	135	28	152	50	155	90	163	124
15	514	43	515	60	560	105	560	285

Weighed amounts of pure quartz and sodium carbonate were added to 10 ml. of water in a pressure bomb and rocked up to 150 hours at each temperature. The data for NaOH are from Tuttle and Friedman.

Additional data by Friedman, 1949 covers NaOH solutions containing 1 - 13% Na<sub>2</sub>O from 250 - 450°.

For data on the system SiO<sub>2</sub> - Na<sub>2</sub>O - H<sub>2</sub>O up to 600°, 2000 bars see Morey, 1953.

SiO<sub>2</sub> solubilities in dilute K<sub>2</sub>CO<sub>3</sub>, Na<sub>2</sub>CO<sub>3</sub>, NaOH, Li<sub>2</sub>CO<sub>3</sub>, KCl and NaCl solutions at 500°, 500 bars are given by Wyart and Sabatier, 1955.

A review of SiO<sub>2</sub> solubilities near the critical point is given by Booth and Bidwell, 1948.

## SI SILICON

### SOLUBILITY OF SILICA IN MELTED CALCIUM CHLORIDE (Arndt and Lowenstein, 1909)

t°	Gms. SiO <sub>2</sub> per 100 Gms. Sat. Solution
800	2.5
850	3.8
900	5.4
950	7.6

## W SILICO TUNGSTIC ACID H<sub>8</sub>SiW<sub>12</sub>O<sub>42</sub>

100 gms. H<sub>2</sub>O dissolve 961.5 crystallized silico tungstic acid at 18°, and the solution has Sp. Gr. 2.843.

## Sm SAMARIUM

### BrO SAMARIUM BROMATE Sm(BrO<sub>3</sub>)<sub>3</sub>

#### SOLUBILITY OF SAMARIUM BROMATE IN WATER (James, Fogg, McIntire, Evans and Donovan, 1927)

t°	Gms. per 100 gms. sat. sol.		t°	Gms. per 100 gms. sat. sol.	
	Sm(BrO <sub>3</sub> ) <sub>3</sub> ·9H <sub>2</sub> O	Sm(BrO <sub>3</sub> ) <sub>3</sub>		Sm(BrO <sub>3</sub> ) <sub>3</sub> ·9H <sub>2</sub> O	Sm(BrO <sub>3</sub> ) <sub>3</sub>
0	33.24	25.50	25	53.97	41.40
5	37.58	28.83	30	57.54	44.14
10	42.02	32.23	35	61.12	46.88
15	46.21	35.45	40	64.67	49.61
20	50.16	38.48	45	68.16	52.28

Solid phase Sm(BrO<sub>3</sub>)<sub>3</sub>·9H<sub>2</sub>O in all cases.

### CH SAMARIUM ACETATE Sm(CH<sub>3</sub>COO)<sub>3</sub>·3H<sub>2</sub>O

100 gms. sat. solution of samarium acetate in water contain 13.05 gm. Sm(CH<sub>3</sub>COO)<sub>3</sub> at 25°. (Meyer and Muller, 1920.)

### SAMARIUM LACTATE Sm(C<sub>3</sub>H<sub>5</sub>O<sub>3</sub>)<sub>3</sub>·1½H<sub>2</sub>O

1000 cc. sat. solution of samarium lactate in water contain 11.47 gms. Sm(C<sub>3</sub>H<sub>5</sub>O<sub>3</sub>)<sub>3</sub>·1½H<sub>2</sub>O at 20°. (Jantsch, 1926.)

**Samarium Glycolate**  $\text{Sm}(\text{C}_2\text{H}_3\text{O}_3)_2$ 

100 gms.  $\text{H}_2\text{O}$  dissolve 0.6373 gm.  $\text{Sm}(\text{C}_2\text{H}_3\text{O}_3)_2$  at  $20^\circ$ . (Jantsch and Grünkraut, 1912-13.)

**Samarium Sulfonates**

## SOLUBILITY IN WATER

Salt and Formula	$t^\circ$	Gm. Anhydrous Salt per 100 Gms. $\text{H}_2\text{O}$	Authority
Samarium m Nitrobenzene Sulfonate $\text{Sm}[\text{C}_6\text{H}_4(\text{NO}_2)\text{SO}_3]_3 \cdot 7\text{H}_2\text{O}$	15	50.9	Holmberg, 1907
Samarium Bromonitrobenzene Sulphonate $\text{Sm}[\text{C}_6\text{H}_3(1)\text{Br}(4)\text{NO}_2(2)\text{SO}_3]_3 \cdot 10\text{H}_2\text{O}$	25	7.84	Katz and James, 1913

**Samarium Acetylacetonate**  $\text{Sm}[\text{CH}(\text{COCH}_3)_2]_3$ SOLUBILITY IN ORGANIC SOLVENTS  
(Erametsa and Hamala, 1958)

Solvent	$t^\circ$	Gms. $\text{Sm}_2\text{O}_3$ per 1000 ml.	Solvent	$t^\circ$	Gms. $\text{Sm}_2\text{O}_3$ per 1000 ml.
carbon tetrachloride	20	0.66	acetylacetonate	20	1.74

## Sm SAMARIUM

### DISTRIBUTION OF SAMARIUM NITRATE BETWEEN WATER AND n-HEXYL ALCOHOL AT 25° (Templeton, 1949)

The salt was prepared from "pure" samarium oxide and probably contained excess nitric acid.

Wt. % $\text{Sm}_2\text{O}_3$ in		Wt. % $\text{Sm}_2\text{O}_3$ in	
Aqueous Phase	Alcohol Phase	Aqueous Phase	Alcohol Phase
30.2	5.88	22.7	0.64
28.0	3.33	20.6	.38
25.1	1.37	18.6	.20

Data for the distribution of  $\text{Sm}(\text{NO}_3)_3$  between aqueous  $\text{HNO}_3$  solutions and tributyl phosphate are given by Knapp, Smutz and Spedding, 1956 and by Weaver, Kappelmann and Topp, 1953.

## NO SAMARIUM DOUBLE NITRATES

SOLUBILITY IN CONCENTRATED  $\text{HNO}_3$  OF  $d_{16} = 1.325$  AT 16°  
(Jantsch, 1912)

	Gms. Hydrated Salt per 100 cc. Sat. Sol.
Samarium Magnesium Nitrate $[\text{Sm}(\text{NO}_3)_6] \cdot \text{Mg}_3 \cdot 24\text{H}_2\text{O}$	24.55
Samarium Nickel Nitrate $[\text{Sm}(\text{NO}_3)_6] \cdot \text{Ni}_3 \cdot 24\text{H}_2\text{O}$	29.11
Samarium Cobalt Nitrate $[\text{Sm}(\text{NO}_3)_6] \cdot \text{Co}_3 \cdot 24\text{H}_2\text{O}$	34.27
Samarium Zinc Nitrate $[\text{Sm}(\text{NO}_3)_6] \cdot \text{Zn}_3 \cdot 24\text{H}_2\text{O}$	36.47
Samarium Manganese Nitrate $[\text{Sm}(\text{NO}_3)_6] \cdot \text{Mn}_3 \cdot 24\text{H}_2\text{O}$	50.04

## OH SAMARIUM HYDROXIDE $\text{Sm}(\text{OH})_3$

The Ksp is  $2 \times 10^{-24}$ . (Korenman, 1955.);  $8.4 \times 10^{-23}$  (Moeller and Fogel, 1951);  $6.8 \times 10^{-22}$  (Moeller and Kremens, 1944) (all at 25°)

## PO SAMARIUM DIMETHYL PHOSPHATE $\text{Sm}_2[(\text{CH}_3)_2\text{PO}_4]_6$

100 gms.  $\text{H}_2\text{O}$  dissolve 35.2 gms.  $\text{Sm}_2(\text{CH}_3)_2\text{PO}_4$  at 25° and about 10.8 gms. at 95°. (Morgan and James, 1914.)

## SO SAMARIUM SULFATE $\text{Sm}_2(\text{SO}_4)_3$

Q = quad. pt.

Bond and Belton, 1945 reinvestigated the system  $\text{SnBr}_4 - \text{SO}_2$  and found the compound  $2\text{SnBr}_4 \cdot \text{SO}_2$ . This is identical in properties and composition with the heavy liquid layer found previously.

The densities and viscosities of solutions of  $\text{SnBr}_4$  in the following solvents at various temperatures were determined by:

(Kurnakov and Sternin, 1936)

Ethyl Formate Methyl Oxalate  
Ethyl Ether Ethyl Malonate  
Methyl Acetate Ethyl Ester of Ethyl Malonic Acid  
Methyl " " " " " "

(Kurnakov and Woskressenskaya, 1937)

$\text{CO}(\text{OCH}_3)_2$   $\text{C}_2\text{H}_5\text{OH}$   
 $\text{CO}(\text{OC}_2\text{H}_5)_2$   $\text{C}_6\text{H}_5\text{OH}$   
 $\text{B}(\text{OCH}_3)_3$   $(\text{C}_2\text{H}_5)_2\text{S}$   
 $\text{B}(\text{OC}_2\text{H}_5)_3$

Melting points have been determined for:

$\text{SnBr}_4 + \text{SnCl}_4$  (Raeder, 1927)  
 $\text{SnBr}_4 + \text{BBr}_3$  (Adamsky and Wheeler, Jr., 1954)  
 $\text{SnBr}_4 + (\text{C}_2\text{H}_5\text{O})_4\text{Si}$  (Bol'nov, 1955)  
 $\text{SnBr}_4 + \text{TiBr}_4$  (Eingorn, 1950)  
 $\text{SnBr}_4 + \text{O}-\text{CH}_2\text{C}_6\text{H}_5\text{CN}$  (Pushin, Ristic, Parchomenko, and Ubovic, 1942)  
 $\text{SnBr}_4 + \text{Trinitrotoluene}$  (Pushin, et al., 1947)

100 gms. acetone dissolve 55.6 gms.  $\text{SnCl}_2$  at 18°. ( $d_{20} = 1.6.$ )  
(Naumann, 1904.)

100 gms. ether dissolve 11.4 gms.  $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$  at 0°-35.5°.

100 gms. ethyl acetate dissolve 31.2 gms.  $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$  at -2°,  
35.53 gms. at +22° and 73.44 gms. at 82°. (von Laszynski, 1894.)

100 gms. ethyl acetate dissolve 4.46 gms.  $\text{SnCl}_2$  at 18°.  $d_{20}$  of the  
sat. solution = 0.9215. (Naumann, 1910.)

100 gms. 95 per cent formic acid dissolve 4.1 gms.  $\text{SnCl}_2$  at 19°+  
(Aschan, 1913.)

Melting points are given for:

$\text{SnCl}_2 + \text{ZnCl}_2$   
 $\text{SnCl}_2 + \text{SnI}_2$   
 $\text{SnCl}_2 + \text{CsCl}$

(Herrmann, 1911)  
(Karantissis, 1927)  
(Markov and Chernov, 1958a)

## Cl TIN CHLORIDE (Stannic) $\text{SnCl}_4$

### DISTRIBUTION OF STANNIC CHLORIDE BETWEEN WATER AND XYLENE (Smirnoff, 1907)

Very concentrated aqueous stannic chloride solutions were agitated  
with xylene at various temperatures and the amount of  $\text{SnCl}_4$ , in terms of  
Cl, which entered the xylene layer was determined. The amount of Sn and  
Cl in the xylene was found to correspond to  $\text{SnCl}_4$ .

Per cent Cl in  $\text{SnCl}_4 \cdot 3\text{H}_2\text{O}$  = 45.12DISTRIBUTION OF TIN BETWEEN AQUEOUS HYDROCHLORIC ACID AND ETHER AT ROOM TEMPERATURE  
(Mylius, 1911)

When 1 gm. of tin as the chloride,  $\text{SnCl}_4$ , is dissolved in 100 cc. of aqueous hydrochloric acid and shaken with 100 cc. of ether, the following per cents of the metal enter the ethereal layers. With 20% HCl, 17 per cent; with 15% HCl, 28 per cent; with 10% HCl, 23 per cent; with 5% HCl, 10 per cent and with 1% HCl, 0.8 per cent of the tin.

Additional data for the distribution of  $\text{SnCl}_4$  between water and ethyl ether at 18° are given by Smyth, 1928.

Data in the form of a diagram for the system  $\text{SnCl}_4$  + HCl are given by Chretien and Varger, 1935.

\*Goldschmidt and Eckhardt, 1906 report 0.0000135 moles per liter at 25°. Oka, 1940 reports  $2.0 \times 10^{-9}$  moles per liter.

Earlier Data in Aqueous NaOH at 25°

(Goldschmidt and Eckhardt, 1906)

The authors desired to ascertain whether the mono,  $\text{NaHSnO}_2$ , or the disodium salt,  $\text{Na}_2\text{SnO}_2$ , predominates in alkaline tin hydroxide solutions. Given amounts of carefully prepared tin chloride, made from tin and HCl, and sodium hydroxide solutions were mixed in vessels containing hydrogen. The mixtures were shaken at 25° and the clear supernatant solutions in contact with the precipitated  $\text{Sn(OH)}_2$ , analyzed. (See also Rubenbauer, 1902.)

## Sn TIM

### SOLUBILITY OF STANNOUS OXIDE IN PERCHLORIC ACID SOLUTIONS AT 25° (Gorman and Leighton, 1942)

The results are nearly identical with those of Garrett and Heiks (above) and indicate that tin does not form complex ions with  $\text{Cl}^-$ , and that the increased solubility is a function of  $\text{H}^+$  only.

Initial Moles $\text{HClO}_4$ per liter	Moles $\text{SnO}$ per liter	Initial Moles $\text{HClO}_4$ per liter	Moles $\text{SnO}$ per liter	Initial Moles $\text{HClO}_4$ per liter	Moles $\text{SnO}$ per liter

## 3 STANNOUS SULFIDE $\text{SnS}$

Kapustinsky, 1940 calculated the solubility product of stannous sulfide from thermochemical data to be  $1.0 \times 10^{-27}$ . The calculated solubility in various solutions are:

pH	3	5	7	9	11
Moles per liter	$9.6 \times 10^{-7}$	$9.7 \times 10^{-9}$	$1.4 \times 10^{-10}$	$1.0 \times 10^{-11}$	$1.0 \times 10^{-12}$

## 3 STANNIC SULFIDE $\text{SnS}_2$

### SOLUBILITY OF STANNIC SULFIDE IN AQUEOUS SOLUTIONS OF AMMONIA (Epik, 1932)

The determinations were made by boiling mixtures of sulfide and aqueous ammonia of various concentrations for 5 minutes over a Bunsen burner. The solutions thus obtained were analyzed for tin and the residual ammonia.

% concentration of $\text{NH}_3$ in solvent		Gms. $\text{SnS}_2$ dissolved per 100 cc sat. sol.
at beginning	at end	
1.0	0.8	0.13
3.0	2.3	0.33
6.0	3.8	0.49
12.0	7.0	0.85
25.0	12.0	1.26

The effect of variation in time of heating and of the ratio of sulfide to ammonia was also studied.

## Sr STRONTIUM

## Sr STRONTIUM

Melting point diagrams are drawn for the systems Sr -  $\text{SrBr}_2$  and Sr -  $\text{SrI}_2$  by Cubicciotti and Thurmond, 1949, and by Eastman, Cubicciotti and Thurmond, 1950. About 20 - 25% of the metal dissolves in each salt, and there is a large liquid immiscibility gap in each system above 750°.

Data for the system  $\text{Sr} + \text{CaCl}_2 \rightleftharpoons \text{SrCl}_2 + \text{Ca}$  at 1000° are given by Ostertag, 1956.

## AsO STRONTIUM ARSENITES

## AsO STRONTIUM ARSENATES $\text{Sr}_2\text{H}_2(\text{AsO}_4)_2$ $\text{Sr}_3(\text{AsO}_4)_2$

SOLUBILITY OF EACH IN WATER AT 17°  
(Guerin and Michel, 1942)

0.45 gms. of  $\text{Sr}_2\text{H}_2(\text{AsO}_4)_2$  are dissolved in 100 gms. of saturated solution. The solid phase is either the di- or trihydrate.

0.027 gms. of  $\text{Sr}_3(\text{AsO}_4)_2$  are dissolved in 100 gms. of saturated solution. The solid phase is  $\text{Sr}(\text{AsO}_4) \cdot 1.17\text{H}_2\text{O}$ .

Chukhlantsev, 1956 gives the  $K_{sp} [\text{Sr}^{++}]^3 [\text{AsO}_4^{=}]^2 = 8.1 \times 10^{-19}$ .

## THE SYSTEM STRONTIUM BROMIDE - TERTIARY BUTYL ALCOHOL - WATER AT 25° (Ginnings, Herring and Webb, 1933)

The composition of the homogeneous mixture (Plait Point) of the system was found to be 20.4 gms. SrBr<sub>2</sub> + 29.8 gms. ter. (CH<sub>3</sub>)<sub>3</sub>COH + 49.8 gms. H<sub>2</sub>O.

The original results for the remaining points on the binodal curve are not given but only the values of a series of constants calculated by means of empirical equations.

Constant agitation in a thermostat was employed for obtaining saturation. The results are expressed in terms of gram molecules of the saturating salt per 1000 gms. H<sub>2</sub>O "corresponding to the weight molar concentration of the added salt."

## SUBSTITUTED STRONTIUM BENZOATES

CH

SOLUBILITY OF SEVERAL STRONTIUM BENZOATES IN WATER AT 20°  
(Ephraim and Pfister, 1925)

Compound	Formula	Gms. anhydrous compd. per 100 cc. sat. sol.
Strontium Benzoate	$(C_6H_5COO)_2Sr \cdot H_2O$	4.953
Strontium -4 Chloro Benzoate	$(C_6H_4ClCOO)_2Sr \cdot 4H_2O$	1.341
Strontium -4 Methoxy Benzoate	$(C_6H_4OCH_3COO)_2Sr \cdot H_2O$	1.6975
Strontium -4 Nitro Benzoate	$(C_6H_4NO_2COO)_2Sr \cdot 8H_2O$	1.340
Strontium -4 Oxy Benzoate	$(C_6H_5OHCOO)_2Sr \cdot H_2O$	11.098

SOLUBILITY OF STRONTIUM HALOGEN BENZOATES IN 94% ACETONE AT ABOUT 20°  
(Bailar, 1931)

Compound	Formula	Gm. mols. compound per liter
Strontium p-Brom Benzoate	$(C_6H_4BrCOO)_2Sr$	0.00028
Strontium p-Chlor Benzoate	$(C_6H_4ClCOO)_2Sr$	0.0010
Strontium p-Iodo Benzoate	$(C_6H_4ICOO)_2Sr$	0.00026

STRONTIUM SALICYLATE  $(C_6H_4OH \cdot COO)_2Sr \cdot 2H_2O$ 

100 gms. sat. solution in water contain 3.04 gms.  $(C_6H_4OHCOO)_2Sr$  at 15° and 20.44 gms. at 100°. (Tarugi and Checchi, 1901.)

SOLUBILITY OF STRONTIUM SALICYLATE IN AQUEOUS ALCOHOL AT 25°  
(Seidell, 1909, 1910)

Wt. % $C_2H_5OH$ in Solvent	$d_{25}$ of Sat. Sol.	Gms. $(C_6H_4OHCOO)_2Sr \cdot 2H_2O$ per 100 Gms. Sat. Sol.	Wt. % $C_2H_5OH$ in Solvent	$d_{25}$ of Sat. Sol.	Gms. $(C_6H_4OHCOO)_2Sr \cdot 2H_2O$ per 100 Gms. Sat. Sol.
0	1.022	5.04	60	0.923	7.15
10	1.006	4.88	70	0.893	5.90
20	0.993	5.22	80	0.859	4.40
30	0.982	6.20	90	0.824	2.56
40	0.966	7.70	92.3	0.815	2.02
50	0.948	8.08	100	0.790	0.44

The solid phase was  $(C_6H_4OH \cdot COO)_2Sr \cdot 2H_2O$  in all cases except the solution in 100 per cent alcohol, in which partial dehydration and conversion of the crystalline salt to an amorphous bulky white powder occurred.

STRONTIUM HELIANTHATE  $(C_{14}H_{14}N_3SO_3)_2Sr \cdot 4H_2O$ 

1000 cc.  $H_2O$  dissolve 0.126 gm.  $(C_{14}H_{14}N_3SO_3)_2Sr \cdot 4H_2O$  at 20-25°.  
(Stark and Dehm, 1918.)

STRONTIUM CARBONATE  $SrCO_3$ 

CO

## SOLUBILITY IN WATER

One liter of water dissolves 0.00082 gm. at 8.8° and 0.0109 gm. at 24° by conductivity method. (Holleman, 1893; Kohlrausch and Rose, 1893.)

One liter of water saturated with  $CO_2$  dissolves 1.19 gms.  $Sr(HCO_3)_2$ .

Data for the solubility of strontium carbonate in water containing  $CO_2$  at pressures between 0.05 and 1.1 atmospheres are given by McCoy and Smith (1911). The equilibrium constant is  $k = 1.29 \times 10^{-2}$  with an average deviation from the mean of 1.2 per cent. From this value, the solubility product is calculated to be  $Sr \times CO_2 = k_3 = 1.567 \times 10^{-9}$ .

Using the "polarographic" method (see remarks under barium carbonate) Heyrovsky and Berezicky, 1929, found the solubility of strontium carbonate in water to be 0.00028 gm. equivalents per liter.

SOLUBILITY OF STRONTIUM CARBONATE IN WATER SATURATED WITH CARBON DIOXIDE  
AT PRESSURE OF ONE ATMOSPHERE AND OF THIRTY-FIVE ATMOSPHERES AT 18°  
(Haehnel, 1924)

The limit of solubility at 18° was at 25 atmospheres pressure of  $CO_2$ .

Pressure of Carbon Dioxide	Gms. per 100 gms. sat. sol.	
	Carbonate	Bicarbonate
1.0 atmosphere	0.12	0.17
35.0 atmosphere	0.38	0.57

SOLUBILITY OF STRONTIUM CARBONATE IN AQUEOUS AMMONIUM CHLORIDE  
(Cantoni and Goguelia, 1905)

The mixtures were allowed to stand at 12-18° for 98 days.

50	42.0	72.4	"	160	58.5	141.0	"
				180	62.0	163.1	"

Transition temperature about 62.5°. Sp. Gr. of sat. solution at 0° = 1.334; at 15° = 1.36. Data in parentheses are those of Assarsson and Balder, 1953.

More recent determinations of the solubility of strontium chloride in water, made by Menzies, 1936, by a modification of the synthetic method which permitted varying at will the amount of solvent in contact with the solute, are as follows.

t°	Gm. Mols. SrCl <sub>2</sub> per 1000 gms. H <sub>2</sub> O		Solid Phase	t°	Gm. Mols. SrCl <sub>2</sub> per 1000 gms. H <sub>2</sub> O		Solid Phase

Cl

The composition of the homogeneous mixture (plait point) of the system strontium chloride, tertiary butyl alcohol and water at 25°, was found by Ginnings, Herring and Webb, 1933, to be 6.3 percent SrCl<sub>2</sub>, 33.1 percent ter. (CH<sub>3</sub>)<sub>3</sub>COH and 60.6 percent H<sub>2</sub>O. The original results for the remaining points on the binodal curve are not given but only the values of a series of constants calculated by means of empirical equations.

The binodal curve for the system strontium chloride, allyl alcohol and water at 25° has been determined by Ginning and Dees, 1935, but the authors give only the values of a series of constants calculated from their experimental results by means of an empirical equation.

STRONTIUM PERCHLORATE  $\text{Sr}(\text{ClO}_4)_2$ 

ClO

SOLUBILITY IN WATER  
(Lilich and Dzhurinskii, 1956)

Willard and Smith, 1930 found that strontium perchlorate crystallized from water at about  $0^\circ$  apparently contained  $4\text{H}_2\text{O}$ . At about  $25^\circ$  a dihydrate,  $2\text{H}_2\text{O}$ , was obtained. Above  $40^\circ$  the crystals corresponded to the formula  $3\text{Sr}(\text{ClO}_4)_2 \cdot 2\text{H}_2\text{O}$ . The transition point between this compound and the dihydrate was at about  $37^\circ$ . Evidence was also obtained of the possible existence of a monohydrate.

t°	Moles $\text{Sr}(\text{ClO}_4)_2$ per 1000 gms. $\text{H}_2\text{O}$	t°	Moles $\text{Sr}(\text{ClO}_4)_2$ per 1000 gms. $\text{H}_2\text{O}$

STRONTIUM HEXAANTIPYRINE PERCHLORATE  $[\text{Sr}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6](\text{ClO}_4)_2$ 

CrO

100 cc sat. solution of strontium hexa antipyrine perchlorate in water contain 9.68 gms.  $[\text{Sr}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6](\text{ClO}_4)_2$  at  $20^\circ$ . (Wilke-Dorfurt and Schliephake, 1929.)

## Sr STRONTIUM

### CrO STRONTIUM CHROMATE $\text{SrCrO}_4$

#### SOLUBILITY OF STRONTIUM CHROMATE IN WATER (Davis and Ricci, 1939)

Equilibrium is approached with such extreme slowness that the following results may be subject to slight revision.

t°	Gms. $\text{SrCrO}_4$ per liter
15	0.879 (?)
25	0.91
75	0.62
100	0.43

#### SOLUBILITY OF STRONTIUM CHROMATE IN SEVERAL SOLVENTS AT 15° (Fresenius, 1891)

	Gms. $\text{SrCrO}_4$ per 100 Gms. Solvent		Gms. $\text{SrCrO}_4$ per 100 Gms. Solvent
Water	0.12	Aq. Ethyl Alcohol (29%)	0.0132
Aq. $\text{NH}_4\text{Cl}$ (5%)	0.195	Aq. Ethyl Alcohol (53%)	0.002
Aq. $\text{CH}_3\text{COOH}$ (1%)	1.57		

#### SOLUBILITY OF STRONTIUM CHROMATE IN ETHYL ALCOHOL SOLUTIONS (Davis, 1942)

Solutions rotated with solid strontium chromate did not become saturated for more than a year, and the determinations are complicated by the slow hydration of the solid (to form a mono- or dihydrate). Some reduction of the chromate by alcohol took place upon standing for long periods of time. The lower results of previous authors are probably the result of unsaturation. Results below are in grams  $\text{SrCrO}_4$  per 100 gms. saturated solution.

Wt. % $\text{C}_2\text{H}_5\text{OH}$	(Approx. Volume %)	25°	50°	75°

SOLUBILITY OF STRONTIUM FLUORIDE IN AQUEOUS SOLUTIONS  
OF HYDROCHLORIC ACID AT 25°(?)  
(Tananaev and Tchrelachwilli, 1936)

Normality of aq. HCl	Gm. Mol. SrF <sub>2</sub> dissolved per liter	pH of sat. sol.
0.01	0.0038	2.20
0.10	0.0220	1.03
1.0	0.1240	0.07

0.02 gms. SrF<sub>2</sub> dissolve in 100 gms. liquid SO<sub>2</sub> at 25°. (Watt, Jenkins and Robertson, 1950.)

Melting points in the system SrF<sub>2</sub> - Al<sub>2</sub>O<sub>3</sub> - SiO<sub>2</sub> are given by Ershova, 1957. For the system SrF<sub>2</sub> - SrO - SiO<sub>2</sub> see Ershova and Ol'shanskii, 1957.

STRONTIUM HEXA ANTIPYRINE FLUOBORATE Sr(COC<sub>10</sub>H<sub>12</sub>N<sub>2</sub>)<sub>6</sub>(BF<sub>4</sub>)<sub>2</sub>

100 cc sat. solution of strontium hexa antipyrine boro fluoride in water contain 3.8 gms. Sr(COC<sub>10</sub>H<sub>12</sub>N<sub>2</sub>)<sub>6</sub>(BF<sub>4</sub>)<sub>2</sub> at 20°. (Wilke-Dorfurt and Mureck, 1929.)

STRONTIUM FLUOPHOSPHATE SrPO<sub>3</sub>F.H<sub>2</sub>O

One liter sat. solution of strontium phospho fluoride in water contains 0.055 gm. mols. SrPO<sub>3</sub>F at 20°. (Lange, 1929.)

## Sr STRONTIUM

### STRONTIUM FLUOSILICATE $\text{SrSiF}_6$

At 15° a saturated solution in water contains 3.22%  $\text{SrSiF}_6$ .

100 gms. of a sat. solution of strontium fluosilicate in a solvent composed of 135 cc.  $\text{H}_2\text{O}$  + 9.0 cc. of 1.0 n  $\text{HCl}$  + 1.5 gm.  $(\text{NH}_4)_2\text{SiF}_6$  + 48 cc.  $\text{C}_2\text{H}_5\text{OH}$  contain 1.061 gm.  $\text{SrSiF}_6$  at 18°.5. (Leo, 1923.)

## H STRONTIUM HYDRIDE $\text{SrH}_2$

Phase diagrams for the systems  $\text{SrH}_2 - \text{SrBr}_2$  and  $\text{SrH}_2 - \text{SrI}_2$  are reported by Ehrlich and Gortz (1956) and Ehrlich and Kulke (1956).

## I STRONTIUM IODIDE $\text{SrI}_2$

### SOLUBILITY IN WATER

Average curve from the results of Kremers, 1858; and Etard, 1874.

t°	Gms. $\text{SrI}_2$ per 100 Gms.		Solid Phase	t°	Gms. $\text{SrI}_2$ per 100 Gms.		Solid Phase
	Solution	Water			Solution	Water	
0	62.3	165.3	$\text{SrI}_2 \cdot 6\text{H}_2\text{O}$	90	78.5	365.2	$\text{SrI}_2 \cdot 2\text{H}_2\text{O}$

55.09	0.51	"	22.36	0.57	"
54.16	0.60	"	0.0	0.85	"

Additional data in this system are reported by Milikau, 1916.

SOLUBILITY OF  $\text{SrI}_2$  IN VARIOUS SOLVENTS

Solvent	t°	Solubility
Ethanol	-20	2.6 gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Etard, 1874)
	+ 4	3.1 gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Etard, 1874)
	39	4.3 gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Etard, 1874)
	82	4.7 gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Etard, 1874)
Acetone	20	42.0 gms. $\text{SrI}_2$ per 100 gms. acetone (Altaba, 1951)
liquid $\text{SO}_2$	25	0.14 gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Shatenstein and Viktorov, 1937)
		0.49 <sup>a</sup> gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Watt, Jenkins and Robertson, 1950)
liquid $\text{NH}_3$	0	0.308 gms. $\text{SrI}_2$ per 100 gms. sat. sol. (Linhard and Stephan, 1934)

<sup>a</sup>W. J. and R. used the hemihydrated salt.

STRONTIUM PERIODIDE  $\text{SrI}_4$ 

Data for the formation of strontium periodide in aqueous solution at 25° are given by Herz and Bulla (1911). The experiments were made by adding iodine to aqueous solutions of  $\text{SrI}_2$  and agitating with carbon tetrachloride. From the iodine content of the  $\text{CCl}_4$  layer the amount of iodine in the aqueous layer can be calculated on the basis of the distribution ratio of iodine between water and  $\text{CCl}_4$ . This furnishes the necessary data for calculating the amount of the strontium periodide existing in the aqueous layer.

STRONTIUM IODATE  $\text{Sr}(\text{IO}_3)_2$ 

10

THE SYSTEM  $\text{Sr}(\text{IO}_3)_2 - \text{H}_2\text{O}$

(1) = Linhard and Stephan, 1934; (2) = Hunt and Boncyk, 1933.

Melting points are given for:

Sr(NO <sub>3</sub> ) <sub>2</sub> + SrOH <sub>2</sub>	(Wolf, 1935)
Sr(NO <sub>3</sub> ) <sub>2</sub> + LiNO <sub>3</sub>	(Gromakov and Gromakova, 1953)
Sr(NO <sub>3</sub> ) <sub>2</sub> + CsNO <sub>3</sub>	(Plyushchev, Markina and Shklover, 1956)

STRONTIUM NIOBATES Sr(NbO<sub>3</sub>)<sub>2</sub>

NbO

## SOLUBILITY IN WATER

t°	Solubility	
15	0.00607 gms. Sr(NbO <sub>3</sub> ) <sub>2</sub> ·4H <sub>2</sub> O per liter	(Krylov and Alekseev, 1954)
25	0.01032	"
50	0.01205	"

At 20° the K<sub>sp</sub> of Sr(NbO<sub>3</sub>)<sub>2</sub> is  $4.2 \times 10^{-18}$  (Lapitskii and Pchelkin, 1956).

The solubility of anhydrous strontium hexaniobate in water is  $2.6 \times 10^{-14}$  (?) (Pchelkin and Lapitskii, 1956).

## STRONTIUM OXIDE SrO

O

Fused SrCl<sub>2</sub> dissolves 18.3 gms. SrO per 100 gms. of the fused melt at 910°. (Arndt, 1907.)

# Sr STRONTIUM

## OH STRONTIUM HYDROXIDE $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$

SOLUBILITY IN WATER  
(Scheibler, 1883)

t°	Grams per 100 Grams Solution		Grams per 100 cc. Solution	
	SrO	$\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$	SrO	$\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$

Other data on the solubility of  $\text{SrSO}_4$  in dilute  $\text{HNO}_3$  solutions containing K, Mg, Al and Sr nitrates is given by Chrelashvili and Nadareishvili, 1953.

Using the polarographic method, Heyrovsky and Berezicky, 1929, found the solubility of strontium sulfate in water and dilute aqueous HCl to be:

Normality of aq. HCl	Gm. Equiv. $\text{SrSO}_4$ dissolved per liter
0.0 (= $\text{H}_2\text{O}$ )	0.0015
0.001	0.0011
0.01	0.0018

100 gms. 95 per cent formic acid dissolve 0.02 gm.  $\text{SrSO}_4$  at  $18.5^\circ$ . (Aschan, 1913.)

80

SOLUBILITY OF PRECIPITATED STRONTIUM SULFATE AND  
OF "CELESTINA" IN AQUEOUS SOLUTIONS OF AMMONIUM SULFATE AT  $25^\circ$   
(Gallo, 1935)

Gms. $(\text{NH}_4)_2\text{SO}_4$ per 100 gms. aqueous solvent	Gms. $\text{SrSO}_4$ per 100 cc sat. sol.

5.34	0.0732		

### SOLUBILITY OF STRONTIUM SULFATE IN AQUEOUS CALCIUM NITRATE AT ROOM TEMPERATURE (Raffo and Rossi, 1915)

50

Analyzed solutions of Sr(NO<sub>3</sub>)<sub>2</sub>, Ca(NO<sub>3</sub>)<sub>2</sub> and CaSO<sub>4</sub> were mixed at 60° and allowed to stand at room temperature 1 to 2 days. The resulting SrSO<sub>4</sub> was determined and the difference between the amount found and the amount which would have resulted if all the Sr(NO<sub>3</sub>)<sub>2</sub> had been converted to SrSO<sub>4</sub>, was taken as the amount of SrSO<sub>4</sub> dissolved. Gradually increasing concentrations of Ca(NO<sub>3</sub>)<sub>2</sub> were used.

Gms. per 100 cc. Sat. Sol.		Gms. per 100 cc. Sat. Sol.

$\text{CS}_2$	20	3.118	$\text{CHCl}_3$	20	5.739**
$\text{CS}_2$	25	3.744			

\*When a solution saturated at 20° was cooled to 0° and held there for 12 hours, the saturated solution had the same composition as at 20° (17.42). \*\* $\text{TaCl}_5$  forms colloidal solutions with  $\text{CHCl}_3$ , which yield gels

## Ta TANTALUM

upon cooling. A much longer time was needed to approach "saturation" in this solvent than in the others. The figure given is the result after 50 hours, but may not represent fine equilibrium.

Melting points are given for

TaCl <sub>5</sub> + AlCl <sub>3</sub> + CsCl	(Morozov and Simonich, 1957)
TaCl <sub>5</sub> + AlCl <sub>3</sub>	(Morozov, Korshunov and Simonich, 1956)
TaCl <sub>5</sub> + NaCl	(Morozov, Korshunov and Simonich, 1956)
TaCl <sub>5</sub> + NaCl + AlCl <sub>3</sub>	(Morozov, Korshunov and Simonich, 1956)
TaCl <sub>5</sub> + FeCl <sub>3</sub>	(Morozov, 1956)
TaCl <sub>5</sub> + FeCl <sub>3</sub> + AlCl <sub>3</sub>	(Morozov, 1956)

## F TANTALUM FLUORIDE TaF<sub>5</sub>

Data for the partition of Ta(V) between aqueous HF solutions (1-20N) and diethylether are given by Bock and Herrmann, 1956.

## F TANTALUM POTASSIUM FLUORIDE TaK<sub>2</sub>F<sub>7</sub>

### SOLUBILITY IN AQUEOUS HYDROFLUORIC AND POTASSIUM FLUORIDE SOLUTIONS (Ruff and Schiller, 1911)

The tantalum salt was purified by repeated crystallizations from pure anhydrous HF. After drying at 120°, it was shaken in platinum flasks for 3 hour periods at constant temperature with HF or KF solutions or both together. The saturated solutions were filtered by means of a platinum funnel and subjected to analysis.

The solid phases were identified only by their crystal forms and it is possible that still others may be present.

50	8.07	"

**SO TERBIUM SULFATE  $\text{Tb}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$**

100 gms.  $\text{H}_2\text{O}$  dissolve 3.561 gms.  $\text{Tb}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$  at 20° and 2.51 gms. at 40°. (Jackson and Riennacker, 1930.)

**Te TELLURIUM**

100 gms. methylene iodide,  $\text{CH}_2\text{I}_2$ , dissolve 0.1 gm. Te at 12°. (Retgers, 1893.)

**DISTRIBUTION OF TELLURIUM BETWEEN AQUEOUS HYDROCHLORIC ACID AND  
ETHER AT ROOM TEMPERATURE**  
(Mylius, 1911)

When 1 gm. of tellurium as the chloride,  $\text{TeCl}_4$ , is dissolved in 100 cc. of aqueous  $\text{HCl}$  and shaken with 100 cc. of ether, the following per cents of the metal enter the ethereal layers. With 20%  $\text{HCl}$ , 34 per cent; 15%  $\text{HCl}$ , 12 per cent; 10%  $\text{HCl}$ , 3 per cent; 5%  $\text{HCl}$ , 0.2 per cent and with 1%  $\text{HCl}$ , only a trace of the tellurium.

Fusion-point curves for mixtures of tellurium and each of the following metals are given by Pelabon (1909): Sb, Sn, Pb, Ag, Au and As. Results for mixtures of Te and Zn are given by Kobayashi (1911-12). For Te + Tl see Hahn and Klinger, 1949.

Results for mixtures of Te + Br and Te + I are given by Damiens, 1920, 1921.

## TELLURIUM BROMIDES AND CHLORIDES

SOLUBILITY OF TELLURIUM DOUBLE BROMIDES AND CHLORIDES IN AQUEOUS  
HYDROCHLORIC AND HYDROBROMIC ACIDS AT 22°  
(Wheeler, 1893a)

Tellurium Double Salt	Solvent	Gms. Double Salt per 100 Gms. Solvent	
		of 1.49 Sp. Gr.	of 1.08 Sp. Gr.
Te Caesium Bromide TeBr <sub>4</sub> ·2CsBr	Aq. HBr	0.02	0.13

## Th THORIUM

The solubility of thorium in mercury was found by Parks and Prime, 1936, to be 0.0154 weight percent (= 0.0136 atomic percent) at 25°.

### THORIUM EMANATIONS

A complete list of references for the solubility of thorium emanations in various solvents is given by Markham and Kobe, 1941b.

## BO THORIUM BORATE

The precipitate which results when thorium nitrate is added to a solution of borax is not a stable compound. Solubility determinations made by four successive extractions of it at 18° with water, gave the following gms. of material per 100 gms.  $\text{H}_2\text{O}$ ; 0.5366, 0.1250, 0.0611 and 0.0560. After the fourth extraction, the residue then contained 10.14%  $\text{B}_2\text{O}_3$  and after boiling 10 gms. with 100 cc. of  $\text{H}_2\text{O}$  for 6 hrs. and repeating this four times, it contained 9.63 - 9.81%  $\text{B}_2\text{O}_3$ . (Karl, 1910.)

## CH THORIUM ACETATE $\text{Th}(\text{CH}_3\text{COO})_4$

#### SOLUBILITY IN ORGANIC SOLVENTS AT 30° (Muniyappan and Anjanryalu, 1957, 1957a)

Monoethanol amine	70.81 g. salt per 100 g. solvent
Ethylene glycol	0.41 g. salt per 100 g. solvent
Ethylenediamine	4.30 g. salt per 100 g. solvent

## THORIUM CHLOROACETATES (BASIC)

SOLUBILITY IN WATER AT 25°  
(Karl, 1910)

Name of Salt	Formula	Gms. Salt per 100 Gms. H <sub>2</sub> O
Basic Thorium Monochloroacetate	$(ClCH_2COO)_2Th(OH)_2 \cdot H_2O$	0.0663
Basic Thorium Dichloroacetate	$(Cl_2CHCOO)_2Th(OH)_2$	0.0887
Basic Thorium Trichloroacetate	$(Cl_3CCOO)_2Th(OH)_2$	0.0091

THORIUM m NITROBENZENE SULFONATE  $Th(C_6H_4 \cdot NO_2 \cdot SO_3)_4 \cdot 7H_2O$ 

CH

100 gms. H<sub>2</sub>O dissolve 61 gms. of the anhydrous salt at 15°.  
(Holmberg, 1907.)

THORIUM PICRATE  $Th(C_6H_2N_3O_7)_4 \cdot 10H_2O$ 

100 gms. H<sub>2</sub>O dissolve 0.3052 gm. of the salt at 25°. (Karl, 1910.)

THORIUM HIPPURATE  $Th(C_6H_5 \cdot CO \cdot CH_2 \cdot NH \cdot COO)_4$ 

100 gms. H<sub>2</sub>O dissolve 0.0318 gm. of the salt at 25°. (Karl, 1910.)

A thorium ammonium oxalate of the composition Th(C<sub>2</sub>O<sub>4</sub>.NH<sub>4</sub>)<sub>4</sub>.4H<sub>2</sub>O is described by Brauner (1898). It is partially hydrolytically decomposed in aqueous solution and a solubility determination made by analyzing the solution from which the nearly pure salt began to crystallize, showed that 100 gms. H<sub>2</sub>O contain 90.3 gms. Th(C<sub>2</sub>O<sub>4</sub>.NH<sub>4</sub>)<sub>4</sub>.4H<sub>2</sub>O and 9.3 gms. of (NH<sub>4</sub>)<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (= an additional 1/2 mol. wt.)

0.51 gms.  $\text{Th}(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}$  dissolve in 100 gms. liquid ammonia at 25°. (Watt, Jenkins and McCuiston, 1950.)

### THORIUM OXALATE \_ CHLORIDE

SOLUBILITY OF THORIUM CHLOROOXALATE,  $3\text{Th}(\text{C}_2\text{O}_4)_2 \cdot \text{ThCl}_4 \cdot 2\text{H}_2\text{O}$ , IN AQUEOUS HYDROCHLORIC ACID  
(Colani, 1913)

### F THORIUM FLUORIDE $\text{ThF}_4 \cdot 4\text{H}_2\text{O}$

1000 cc. sat. solution of thorium fluoride in water contain 0.17 gm.  $\text{ThO}_3$  at 25°. (Spitzen, 1917.)

The Ksp in water at 25° is  $5.9 \times 10^{-8}$ . (Dodgen, 1952.)

Data for the distribution of thorium between  $\text{LaF}_3$  crystals and its saturated solutions in 3% and 12%  $\text{HNO}_3$  are given by Khlopin and Merkulova, 1949.

### F THORIUM POTASSIUM FLUORIDE $\text{ThK}_2\text{F}_6 \cdot 4\text{H}_2\text{O}$

1000 cc. sat. sol. of thorium potassium fluoride in water contain 0.4 gm.  $\text{ThO}_2$  at 25°. (Spitzen, 1917.)

### IO THORIUM IODATE $\text{Th}(\text{IO}_3)_4$

At 25°, 0.203 gms. are dissolved in one liter of a saturated solution in water. (Spacu and Spacu, 1948.)

0.08 gms.  $\text{Th}(\text{IO}_3)_4$  dissolve in 100 gms. liquid ammonia at 25°. (Watt, Jenkins and McCuiston, 1950.)

DISTRIBUTION OF THORIUM NITRATE BETWEEN NITROMETHANE  
AND WATER AT 20°--Cont.% ThO<sub>2</sub>

Organic Phase	Aqueous Phase
n-Hexyl Alcohol + 5.0 N HNO <sub>3</sub>	

8.20	27.53
6.76	26.74
6.65	25.97
4.74	25.07
2.36	23.95
1.81	22.53

Systems containing HNO<sub>3</sub> were found to decompose somewhat upon standing and several determinations were also made after 2 to 4 weeks had elapsed.

NO

Data for the partition of Th IV between dibutyl carbitol, ether or methyl isobutyl ketone and 1 - 9 N aqueous HNO<sub>3</sub> are given by Kooi, 1956.

The distribution of Th(NO<sub>3</sub>)<sub>4</sub> between butyl phosphate or butyl ether and HNO<sub>3</sub>, Ca(NO<sub>3</sub>)<sub>2</sub> solutions was studied by Anderson, 1950. Other data using tributyl phosphate and HNO<sub>3</sub> solutions is given by Blackmore, Bearse and Calkins, 1952 and by Alcock, Best, Hesford and McKay, 1958.

The partition of Th(NO<sub>3</sub>)<sub>4</sub> between aqueous HNO<sub>3</sub> (or Ca(NO<sub>3</sub>)<sub>2</sub> solutions) and isobutyl methyl ketone at 20° was studied by Rydberg and Bernstrom, 1957.

Data for the extraction of Th(NO<sub>3</sub>)<sub>4</sub> from solutions containing thiocyanate by n-amyl and n-butyl alcohols by Asselin, Audrieth and Comings, 1950.

THE SOLUBILITY OF THORIUM NITRATE IN ORGANIC SOLVENTS AT 25°  
(Templeton and Hall, 1947)

Th(NO<sub>3</sub>)<sub>4</sub>.4H<sub>2</sub>O was shaken with each solvent, which was of "practical" grade or better, for 5 days. Samples were evaporated in platinum crucibles and the residues ignited to ThO<sub>2</sub>.

Solvent:	Gms. Th(NO <sub>3</sub> ) <sub>4</sub> per 100 gms.	Solvent:	Gms. Th(NO <sub>3</sub> ) <sub>4</sub> per 100 gms.

Diether Ether	42.8	o-Toluidine	.09
Di-n-Butyl Ether	2.69	m-Cresol	.10
Diisocamyl Ether	1.12		

NO

The following values are the highest observed solubilities in solvents which formed very viscous solutions and do not represent true equilibrium.

Ethyl Formate	32.5	Ethylene Glycol	44.4
Methyl Acetate	50	Diethylene Glycol	47.3
Ethyl Acetate	43.4	Hexamethylene Glycol	13.5
Ethyl Propionate	67.1	Glycerol	45.6
Ethyl Butyrate	56.9	Ethylene Glycol Monomethyl	
Ethyl C proate	28.6	Ether	59.2
Ethyl Benzoate	6.3	Ethylene Glycol Monoethyl	
Ethyl Phenylacetate	18.42	Ether	54.6
Ethyl Acrylate	12.6	Cyclohexanone	28.5
Methyl Salicylate	2.4	Diethyl Carbonate	8.88
		Isoquinoline	10.5

The validity of these results, which differ considerably from those of Yaffe (1949) has been the subject of some discussion (Yaffe, 1950; Templeton and Hall, 1950). Although Yaffe's data are in different units and at 20°, it is evident that they are very low with respect to those above. The authors conclude that the various solvents must have been of different purity and that the rate of attainment of equilibrium may have been slow. The figures above, therefore, must also be regarded as "practical" solubilities.

Templeton and Hall (1950a) report "total" solubilities of Th(NO<sub>3</sub>)<sub>4</sub> plus other rare earth nitrates in several organic solvents. The degree of "enrichment" in thorium in each case was determined.

100 cc of a saturated solution of thorium nitrate in ethyl ether, prepared by frequent agitation and allowing to stand over night at about 20°, contain 11.22 gms. ThO<sub>2</sub>. A saturated ethereal solution prepared as above but using thorium nitrate dehydrated at 150°, contain only 3.67 gm. TeO<sub>2</sub> per 100 cc. (Wells, 1930.)

A saturated solution of Th(NO<sub>3</sub>)<sub>4</sub>·4H<sub>2</sub>O in tri-n-butyl phosphate at 25 - 27° contains 42.5 wt. % Th(NO<sub>3</sub>)<sub>4</sub>.

THORIUM OXIDE  $\text{ThO}_2$ 

O

THORIUM HYDROXIDE  $\text{Th}(\text{OH})_4$ 

OH

SOLUBILITY OF THORIUM HYDROXIDE IN  $\text{NaOH}$  AND  $\text{HClO}_4$  SOLUTIONS AT  $25^\circ$   
(Gayer and Leider, 1954)

Freshly precipitated  $\text{Th}(\text{OH})_4$  was used.

THORIUM SELENITE  $\text{Th}(\text{SeO}_3)_2$

SeO

The Ksp is  $1.35 \times 10^{-20}$ . (Krylov and Chukhlantsev, 1957.)

THORIUM SELENATE  $\text{Th}(\text{SeO}_4)_2 \cdot 9\text{H}_2\text{O}$

SeO

100 gms.  $\text{H}_2\text{O}$  dissolve 0.498 gm.  $\text{Th}(\text{SeO}_4)_4$  at 0° and 1.972 gms. at 100°. (Cleve, 1885.)

## Ti TITANIUM

## Ti TITANIUM

The percentage of titanium in mercury at 20°, determined by filtering an amalgam of the metal through a sintered glass filter, was found by Irvin and Russell, 1932, to be less than  $1 \times 10^{-5}$ .

A review of the solubility of various metals and non-metals in titanium is given by Kornilov, 1954.

The systems Ti-C, Ti-N, Ti-B and Ti-Be were studied by Ehrlich, 1949.

## Br TITANIUM TETRABROMIDE

Determinations of the reciprocal solubility of titanium tetrabromide and sulfur dioxide, determined by the synthetic method, are given by Bond and Crone, 1934.

## CH TITANIUM SALICYLATES

(Results of Sudarikov and Smirnov, 1956 at 20°)

A = titanium sodium salicylate  $\text{Ti}(\text{HOC}_6\text{H}_4\text{COO})_2 \cdot \text{Na}(\text{HOC}_6\text{H}_4\text{COO}) \cdot 3\text{H}_2\text{O}$

B = titanium ammonium salicylate  $\text{Ti}(\text{HOC}_6\text{H}_4\text{COO})_2 \cdot \text{NH}_4(\text{HOC}_6\text{H}_4\text{COO}) \cdot 3\text{H}_2\text{O}$

			B	Acetone	0.93

## Cl TITANIUM TETRACHLORIDE $\text{TiCl}_4$

100 gms. sat. solution of titanium tetrachloride in selenium oxychloride ( $\text{SeOCl}_2$ ) contains 0.75 gm.  $\text{TiCl}_4$  at 25°. (Wise, 1923.)

Melting point data are given for  $\text{TiCl}_4$  and the following:

Naphthalene (1), propionitrile (2)(6), benzonitrile (2)(6), p-tolunitrile (2), trinitrotoluene (3), nitrobenzene (4), chlorobenzene (4), o-nitrotoluene (4), bromobenzene (4), 1,3,4 nitroxytol (4), m-dinitrobenzene (4)(6), m-dinitrotoluene (4), trinitrotoluene (4), carbon tetrachloride (5), sulfur dioxide (7), methyl acetate (8), ethyl acetate (8), propyl acetate (8), butyl acetate (8), isobutyl acetate (8), isoamyl acetate (8), ethyl formate (8), butyl formate (8), isobutyl

formate, isoamyl formate (8), n-butyl chloroacetate (8), isobutyl chloroacetate (8), isoamyl chloroacetate (8), ethyl propionate (8), ethylbutyrate (8).

(1) Pushin, 1948a, (2) Pushin, Ristic, Parchmenko, and Ubovic, 1942, (3) Pushin, et al., 1947, (4) Pushin, Nikolic, Radojein, and Voropcnova, 1942, (5) Nasu, 1933, (6) Herzel and Demmer, 1932, (7) Bond and Stephens, 1929, (8) Lysenko, Osipov and Akopov, 1956.

Melting point data are given for:

$TiCl_4 + MgCl_2$	(Komarek and Herasymenko, 1958)
$TiCl_4 + FeCl_3$	(Saheki and Funaki, 1957) (Morozov and Toptygin, 1957)
$TiCl_4 + NaCl$	(Komarek and Herasymenko, 1958a)
$TiCl_4 + FeCl_3 + NaCl$	(Morozov and Toptygin, 1957)
$TiCl_4 + FeCl_3 + AlCl_3$	(Morozov and Toptygin, 1957)
$TiCl_4 + CH_3Cl, + CH_2Cl_2, + CHCl_3, + C_2H_5Cl,$	(Lefgworth,
$+ i-C_3H_7Cl, + C_2H_4Cl_2$	Plesch and Rigbi, 1958)
$TiCl_4 + CCl_4$	(Sackmann, 1955)

#### TITANIUM POTASSIUM HEXAFLUORIDE $TiK_2F_6$

F

100 cc. sat. solution of titanium potassium hexa fluoride in aq. 0.125 n hydrofluoric acid contain 0.0483 gm. mols.  $TiK_2F_6$  at 20°. (V. Hevesy, Christiansen and Berglund, 1925.)

#### TITANIUM DIOXIDE $TiO_2$

0

Mironov and Odnosevtsev, 1957, estimate the  $K_{sp}$  of  $Ti(OH)_4$  to be  $7.94 \times 10^{-54}$  by potentiometric titrations.

#### THE SYSTEM TITANIUM DIOXIDE - SULFURIC ACID - WATER AT 25° (Reinders and Kies, 1940)

This system was studied further by Pamfilov and Khudyakova, 1949. Only the dehydrate could be isolated with certainty.

## Tl THALLIUM

The system was studied at 100° by Sagawa (quoted by Reinders and Kies), 1936 who found the stable solid phases to be  $\text{TiO}_2 \cdot n\text{H}_2\text{O}$ ,  $\text{TiO}_2 \cdot \text{SO}_3 \cdot \text{H}_2\text{O}$ ,  $2\text{TiO}_2 \cdot 3\text{SO}_3 \cdot 5\text{H}_2\text{O}$ ,  $\text{TiO}_2 \cdot 4\text{SO}_3 \cdot 4.5\text{H}_2\text{O}$ , and  $\text{TiO}_2 \cdot 4\text{SO}_3 \cdot 2\text{H}_2\text{O}$ . The saturated solution in equilibrium with  $\text{TiO}_2 \cdot n\text{H}_2\text{O}$  and  $\text{TiO}_2 \cdot \text{SO}_3 \cdot \text{H}_2\text{O}$  contains 0.32%  $\text{TiO}_2$  and 41.9%  $\text{H}_2\text{SO}_4$ .

### SOLUBILITY OF TITANIUM OXIDE IN AQUEOUS SOLUTION OF ALKALIS (Auger, 1923)

The temperature is not stated and the manner in which the determinations were made is not clearly described.

Solvent	Gm. $\text{TiO}_2$ per liter	Solvent	Gm. $\text{TiO}_2$ per liter
Aq. 10 % NaOH	0.02-0.025	Aq. 12 % $\text{KHCO}_3$	0.50
Aq. 36 % NaOH	0.06-0.10	Aq. 25 % $\text{KHCO}_3$	2.75
Aq. 10 % KOH	0.30-0.45	Aq. saturated $\text{KHCO}_3$	7.00
Aq. 10 % KOH	0.70-0.90	Aq. 30 % $\text{K}_2\text{CO}_3$	0.02
Aq. 10 % $\text{NaHCO}_3$	0.25	Aq. saturated $\text{K}_2\text{CO}_3$	0.30

Data for the system  $\text{TiO}_2 - \text{H}_2\text{O} - \text{NaCl}$  showing the formation of  $\text{H}_2\text{TiO}_3$  and  $\text{H}_2\text{Ti}_2\text{O}_5$  are given by Kasimov, 1956.

6.9%  $\text{TiO}_2$  dissolve in cryolite at 1000°C. (Hayakawa and Kido, 1952.)

## BO THALLIUM BORATES $\text{TlBO}_2$ , $\text{Tl}_3\text{BO}_2$ and $\text{Tl}_4\text{B}_2\text{O}_5$

Freezing-point data, for the system  $\text{Tl}_2\text{O} + \text{B}_2\text{O}_3$ , which show the formation of the above three compounds are given by Canneri and Morelli, 1922.

## Br THALLIUM BROMIDE $\text{TlBr}$

### SOLUBILITY OF THALLIUM BROMIDE IN WATER

The results of Kohlrausch, 1908; Noyes, 1890; and Osborg, 1926, were plotted and the following results taken from the curve. The results above 100° are by Benrath, Gjeddebo, Schiffers and Wunderlich, 1937.

t°	Gms. $\text{TlBr}$ per liter sat. sol.	Solid Phase	t°	Gms. $\text{TlBr}$ per liter sat. sol.	Solid Phase

## CH THALLIUM FORMATE $\text{TlCO}_2\text{H}$

Freezing point data and the solubility of thallium formate in water up to 60° are reported by Taft and Horsley, 1942. The densities, conductivities, viscosities, and surface tensions of dilute solutions were also determined.

## THALLIUM METHIONATE $\text{Ti}_2[\text{CH}_2(\text{SO}_3)_2]$

100 gms.  $\text{H}_2\text{O}$  dissolve 6.42 gms.  $\text{Ti}_2[\text{CH}_2(\text{SO}_3)_2]$  at 25°. (Backer and Terpstra, 1929.)

## THALLIUM CHLORMETHIONATE $\text{Ti}_2\text{CH}_3\text{Cl}(\text{SO}_3)_2$

100 gms.  $\text{H}_2\text{O}$  dissolve 0.1438 gm. mols.  $\text{Ti}_2\text{CH}_3\text{Cl}(\text{SO}_3)_2$  at 25°. (Backer, 1930.)

## THALLOUS METHOXIOE AND ETHOXIDE

### SOLUBILITY OF EACH SEPARATELY IN ALCOHOL AND BENZENE AT 25° (Sidgwick and Sutton, 1930)

Compound	Formula	Solvent	Gms. Compound per 100 gms. solvent
Thallos methoxide	$\text{TlOCH}_3$	$\text{CH}_3\text{OH}$	1.703
Thallos methoxide	$\text{TlOCH}_3$	$\text{C}_6\text{H}_6$	3.160
Thallos ethoxide	$\text{TlOC}_2\text{H}_5$	$\text{C}_2\text{H}_5\text{OH}$	9.108

Results for the solubility of several thallium derivatives of beta-di ketones and beta ketonic esters in n hexane at 27° are given by Menzies and Walker, 1936.

THALLIUM ACETATE  $\text{TlCH}_3\text{COO}$ 

CH

100 gms. liquid sulfur dioxide ( $\text{SO}_2$ ) dissolve 7.5 gms.  $\text{TlCH}_3\text{COO}$  at  $0^\circ$ .

THALLIUM TRIFLUOROACETATE  $\text{CF}_3\text{COOTl}$ 

SOLUBILITY IN VARIOUS SOLVENTS  
(Swarts, 1939)

Water	$20.5^\circ$	86.7% (d. $\approx 2.85$ )
alcohol	$20^\circ$	88%
benzene	$16^\circ$	1.6%
	$59.6^\circ$	2 liquids + 1 solid in equilibrium
	$60^\circ$	$\left\{ \begin{array}{l} \text{liquid I} = 83.3\% \text{ CF}_3\text{COOTl} \\ \text{liquid II} = 9.7\% \text{ CF}_3\text{COOTl} \end{array} \right.$

# THALLIUM CYANIDE TlCN and Double Cyanides

CN

SOLUBILITY IN WATER  
(Fronmüller, 1878)

Cyanide and Formula	Gms. Salt per 100 Gms. H <sub>2</sub> O
Tl Cyanide, TlCN	16.8 at 28.5°
Tl Cobalti Cyanide $Tl_3Co(CN)_6$	3.6 at 0°; 5.86 at 9.5°; 10.04 at 19.5°.
Tl Zinc Cyanide $2TlCN \cdot Zn(CN)_2$	8.7 at 0°; 15.2 at 14°; 29.6 at 31°.
Tl Ferro Cyanide $Tl_4Fe(CN)_6 \cdot 2H_2O$	0.37 at 18°; 3.93 at 101°. (Lamy.)

100 gms. liquid sulfur dioxide dissolve 0.012 gm. TlCN at 0°.  
(Jander and Ruppolt, 1937.)

# Tl THALLIUM

## SCN THALLIUM THIOCYANATE TlSCN

### SOLUBILITY IN WATER AND IN AQUEOUS SALT SOLUTIONS (Böttger, 1903; Noyes, 1890; Noyes and Abbott, 1895)

One liter sat. aq. solution contains 3.154 gms. TlSCN at 20°, 3.905 gms. at 25°, and 7.269 gms. at 39.75° Suzuki, 1952 reports the Ksp at 25° to be  $1.70 \times 10^{-4}$ .

t°	Gms. Mols. per Liter		Gms. per Liter	
	Salt	TlSCN	Salt	TlSCN
In aqueous salt solution of thallium bromate TlBrO <sub>2</sub> (excess):				
39.75	0.01496	0.0221	4.966	5.793 (N. & A.)
In aqueous salt solution of thallium nitrate TlNO <sub>3</sub> :				
25	0.0227	0.00852	6.04	2.233 (N.)
25	0.0822	0.00406	21.88	1.064
In aqueous salt solution of potassium thiocyanate, KSCN:				
25	0.0227	0.0083	2.208	2.176 (N.)

### SOLUBILITY OF THALLIUM THIOCYANATE IN GELATIN SOLUTIONS AT 40° (Eversole and Thomas, 1943)

The addition of a gelatin was found to increase the water solubility of the salt and the effect is about the same whether iso-electric gelatin (pH  $\approx$  4.7) or cationic (HAc added until pH  $\approx$  3.6) or ionic (NaOH added pH  $\approx$  6) gelatin was used. Results are in grams per 1000 gms. of water.

pH $\approx$ 4.7		pH $\approx$ 3.6		pH $\approx$ 6	
Gelatin	TlCNS	Gelatin	TlCNS	Gelatin	TlCNS
0.0	7.39	23.17	8.14	23.01	7.93
22.30	7.82	44.03	8.58	43.25	8.39
45.20	8.35	63.03	9.17	64.12	8.77
66.58	8.58				

The solubility of thallous thiocyanate in solutions of egg albumin at 25° was determined by Eversole and Bjork, 1939.

100 gms. liquid sulfur dioxide dissolve 0.024 gm. TlSCN at 0°.  
(Jander and Ruppolt, 1937.)

THALLIUM CARBONATE  $Tl_2CO_3$ 

CO

SOLUBILITY IN WATER  
(Crookes, 1864; Lamy, 1863)

t°:	15.5°	18°	62°	100°	100.8°
Gms. $Tl_2CO_3$ per 100 gms. $H_2O$	4.2(C.)	5.23	12.85	27.2(C.)	22.4

The  $K_{sp}$  (activity product) of  $Tl_2CO_3$  is  $1.25 \times 10^{-4}$  (Saegusa, 1950)

100 gms. liquid sulfur dioxide dissolve 0.01 gm.  $Tl_2CO_3$  at 0°.  
(Jander and Ruppolt, 1937.)

Fusion-point data for  $Tl_2CO_3 + TlNO_3$  are given by Broun, 1933.

THALLIUM OXALATE  $Tl_2C_2O_4$ 

CO

One liter of saturated aqueous solution contains 15.77 gms.  $Tl_2C_2O_4$  at 20°, and 18.69 gms. at 25°. (Bottger, 1903; Abegg and Spencer, 1905.)

SOLUBILITY OF THALLOUS CHLORIDE IN AQUEOUS SOLUTIONS OF SALTS  
(Butler and Hiscocks, 1926)

Constant agitation was employed and equilibrium was approached from above and from below. The thallium was determined by titration with standard permanganate except in cases where thallos salts were used in the solvent.

CI

SOLUBILITY OF THALLIUM CHLORIDE IN GELATIN SOLUTIONS AT 40°  
(Eversole and Thomas, 1943)

Addition of gelatin increases the aqueous solubility of the salt. Isoelectric (pH  $\approx$  4.7), positive (HAc added until pH  $\approx$  3.6), and negative (NaOH added until pH  $\approx$  6) gelatin all showed about the same effect.

Grams per 1000 gms. of Water

pH $\approx$ 4.7		pH $\approx$ 3.6		pH $\approx$ 6	
Gelatin	TlCl	Gelatin	TlCl	Gelatin	TlCl
0.0	6.12	19.70	6.35	20.33	6.41

39.14	.01647	31.03	.01657
47.49	.01667		

The solubility of thallos chloride in solutions of egg albumin at 25° was determined by Eversole and Bjork, 1939.

One liter of 90% alcohol dissolves 0.0038 gm. TlCl. (Long, 1888.)

## TI THALLIUM

One liter of 50 per cent alcohol dissolves 0.027 gm.  $\text{TlCl}$ . (Long, 1888.)

100 gms. methyl alcohol ( $\text{CH}_3\text{OH}$ ) dissolve 0.000029 gm. equiv.  $\text{TlCl}$  at  $25^\circ$ . (Buckley and Hartley, 1929.)

100 gms. liquid sulfur dioxide ( $\text{SO}_2$ ) dissolve 0.007 gm.  $\text{TlCl}$  at  $0^\circ$ . (Jander and Ruppolt, 1937.)

Melting points have been determined for:

## ClO THALLIUM CHLORATE $\text{TlClO}_3$

### SOLUBILITY IN WATER (Muir, 1876)

	$0^\circ$	$20^\circ$	$50^\circ$	$80^\circ$	$100^\circ$
Gms. $\text{TlClO}_3$ per 100 gms. $\text{H}_2\text{O}$ :	2	3.92	12.67	36.65	57.31

One liter sat. aq. solution contains 38.51 gms.  $\text{TlClO}_3$  at  $20^\circ$ . (Noyes and Farrel, 1911.)

One liter of aqueous solution, saturated with both salts, contains 30.4 gms.  $\text{TlClO}_3$  + 34.43 gms.  $\text{Ti}_2\text{SO}_4$  at  $20^\circ$ . (Noyes and Farrel, 1911.)

### SOLUBILITY OF MIXED CRYSTALS OF THALLIUM CHLORATE AND POTASSIUM CHLORATE IN WATER AT $10^\circ$ (Roozeboom, 1891)

NOTE.--Solutions of the two salts were mixed in different proportions and allowed to crystallize, such amounts being taken that not more than one or two grams would separate from one liter.

100 gms. liquid sulfur dioxide (SO<sub>2</sub>) dissolve 0.013 gm. TlClO<sub>4</sub> at  
0°. (Jander and Ruppolt, 1937.)

THALLIUM CHROMATE Tl<sub>2</sub>CrO<sub>4</sub>

CrO

100 gms. H<sub>2</sub>O dissolve 0.03 gm. Tl<sub>2</sub>CrO<sub>4</sub> at 60°, and 0.2 gm. at 100°.  
(Browning and Hutchins, 1900.)

1 liter of aq. 31 per cent KOH solution dissolves 18 gms. Tl<sub>2</sub>CrO<sub>4</sub>.  
(Lepierre and Lachland, 1891.)

## Tl THALLIUM

### SOLUBILITY OF THALLIUM CHROMATE IN WATER AND IN AQUEOUS SOLUTIONS AT 20° (Moser and Brukl, 1926)

Constant agitation was employed for securing saturation.

	Solvent	Gms. $Tl_2CrO_4$ per liter sat. sol.
CrO	Water	0.0427
	Aq. 60% Ethyl Alcohol	0.0092
	Aq. 70% Ethyl Alcohol	0.0080
	Aq. 80% Ethyl Alcohol	0.0072
	Aq. 96% Ethyl Alcohol	0.0060
	Aq. 2% $NH_3$ + 1% $K_2CrO_4$	0.0100
	Aq. 2% $NH_3$ + 2% $K_2CrO_4$	0.0095
	Aq. 5% $NH_3$ + 2% $K_2CrO_4$	0.0142
	Aq. 10% $NH_3$ + 2% $K_2CrO_4$	0.0205
	Aq. 2% $NH_3$ + 4% $K_2CrO_4$ + 10% Alcohol	0.0060

Reaction in the system  $Tl_2CrO_4$  + MgO at 300° was studied by Montignie, 1941a.

### THALLIUM TRICHROMATE $Tl_2Cr_3O_{10}$

One liter of  $H_2O$  dissolves 0.35 gm. thallium trichromate,  $Tl_2Cr_3O_{10}$ , at 15°, and 2.27 gms. at 100°. (Crookes, 1864.)

## F THALLIUM FLUORIDE TlF

100 gms.  $H_2O$  dissolve 80 gms. TlF at 15°. (Büchner, 1865.)

## I THALLIUM IODIDE TlI

### SOLUBILITY IN WATER

Average results from Böttger, 1903; Kohlrausch, 1904-05, 1908; Werther; Crookes, 1864; Lamy; Heberling; Jones and Schumb, 1921; Davies and Robinson, 1937.

100 gms. liquid sulfur dioxide (SO<sub>2</sub>) dissolve 0.06 gm. TlI at 0°.  
(Jander and Ruppolt, 1937.)

Data for the temperatures of solidification of mixtures of TlI and TlNO<sub>3</sub> are given by Van Eyk (1901).

Reaction in the system TlI + MgO at 300° was studied by Montignie, 1941a.

# Tl THALLIUM

## SOLUBILITY OF THALLIUM IODATE IN AQUEOUS ALKANE DISULFONATE SOLUTIONS AT 25° (Stone, 1940)

The solvent salts had the general formula  $\text{NaO}_3\text{S}(\text{CH}_2)_x\text{SO}_3\text{Na}$ .  
Results are in moles  $\text{TlIO}_3$  per liter  $\times 10^{-6}$ . The solubility of  $\text{TlIO}_3$  in  
water was  $1833 \times 10^{-6}$  moles per liter.

20.3	1.6	$TlReO_4$	42	5.8	$TlReO_4$
21.5	1.7	"	93	15.4	"
24.8	2.1	"			

THALLIUM SULFIDE  $Tl_2S$ 

S

One liter of sat. aqueous solution contains 0.215 gm.  $Tl_2S$  at 20°. (Böttger, 1903.)

The  $K_{sp}$  is  $7 \times 10^{-20}$  at 25°. (Goates, Gordon and Faux, 1952.)

The results of Moser and Behr, 1924, and of Bruner and Zawadski, 1909, 1910, upon the solubility of thallous sulfide in water are critically reviewed and recalculated by Kolthoff, 1931, and by Ravitz, 1936, in connection with similar results upon other methal sulfides.

1000 cc. aq. 0.01 normal  $H_2SO_4$  saturated with  $H_2S$  at 1 atmosphere pressure, dissolve 1.451 gms.  $Tl_2S$  at 20°. (Moser and Behr, 1924.)

A study of the systems  $TlNO_3 - Na_2S - H_2O$  and  $TlCl_2H_2O_2 - Na_2S - H_2O$  only the sulfide  $Tl_2S$  is obtained. In the system  $TlNO_3 - Pb(NO_3)_2 - Na_2S - H_2O$  the mixed sulfide  $Tl_2S \cdot PbS$  is formed. (Nanobashvili, Shelia and Ivanitskaya, 1957.)

A diagram and discussion of the fusion points of  $Tl_2S + S$ ,  $Tl_2S + Se$  and  $Tl_2S + Te$  are given by Pelabon, 1907.

THALLIUM SULFITE  $Tl_2SO_3$ 

SO

100 gms.  $H_2O$  dissolve 3.34 gms.  $Tl_2SO_3$  at 15.5°. (Seubert and Elten, 1892.)

100 gms. liquid sulfur dioxide ( $SO_2$ ) dissolve 0.242 gm.  $Tl_2SO_3$  at 0°. (Jander and Ruppolt, 1937.)

(Cont)

The diagram given by the authors contains three branches, corresponding respectively to the solubility of  $Tl_2O_3$  in dilute sulfuric acid and of the two sulfates,  $Tl(OH)SO_4 \cdot 2H_2O$  and  $HTl(SO_4)_2 \cdot 4H_2O$ , in stronger acid. The existence of the basic salt  $Tl(OH)SO_4 \cdot 2H_2O$  requires a concentration of at least 10%  $H_2SO_4$ . The space diagram but not the numerical data is given for determinations at temperatures between  $20^\circ$  and  $95^\circ$ .

SOLUBILITY OF THALLIUM SULFATE IN AQUEOUS SOLUTIONS OF SULFURIC  
ACID AT  $25^\circ$

## SOLUBILITY OF THALLIUM SULFATE IN GELATIN SOLUTIONS AT 40° (Eversole and Thomas, 1943)

Addition of gelatin usually increases the aqueous solubility of the salt. Isoelectric (pH  $\approx$  4.7), positive (HAc added until pH  $\approx$  3.6), and negative (NaOH added until pH  $\approx$  6) gelatin all showed about the same effect.

### Grams per 1000 gms. of Water

pH $\approx$ 4.7		pH $\approx$ 3.6		pH $\approx$ 6	
Gelatin	Tl <sub>2</sub> SO <sub>4</sub>	Gelatin	Tl <sub>2</sub> SO <sub>4</sub>	Gelatin	Tl <sub>2</sub> SO <sub>4</sub>
0.0	76.0	22.49	75.6	21.71	76.3
20.78	76.1	48.23	74.9	45.88	77.0
46.52	77.5	67.20	74.5	65.16	77.9
63.80	78.9				

The solubility of thallous sulfate in solutions of egg albumin at 25° was determined by Eversole and Bjork, 1939.

100 gms. liquid sulfur dioxide (SO<sub>2</sub>) dissolve 0.021 gm. Tl<sub>2</sub>SO<sub>4</sub> at 0°. (Jander and Ruppolt, 1937.)

Melting points are given for Tl<sub>2</sub>SO<sub>4</sub> + CdSO<sub>4</sub>, Tl<sub>2</sub>SO<sub>4</sub> + CdCl<sub>2</sub>, Tl<sub>2</sub>SO<sub>4</sub> + CdSO<sub>4</sub> + CdCl<sub>2</sub> by Sementsova, 1936.

THALLIUM SELENATE  $Tl_2SeO_4$ 

SeO

## SOLUBILITY IN WATER

t°	Gms. $Tl_2SeO_4$ per 100 Gms. $H_2O$	Authority
9.3	2.13	(Tutton, 1907)
12	2.4	(Tutton, 1907)
20	2.8	(Glauser, 1910)
80	8.5	(Glauser, 1910)
100	10.86	(Tutton, 1907)

The system  $Tl_2O_3 + SeO_3 + H_2O$  at 25° is described by Meyer and Wilk, 1924, but numerical data are not given. It is stated that the curve is almost identical with that of selenium sulfate but the transition point is at 45%  $H_2SeO_4$  instead of at 40%.

## THALLIUM VANADATES

VO

SOLUBILITY IN WATER  
(Carnelly, 1873; Liebig, 1860)

		Gms. Vanadate per 100 Gms. $H_2O$	
		At 15°	At 100°
Thallium meta vanadate	$TlVO_3$	0.087 (11°)	0.21

THULIUM OXALATE  $Tm_2(C_2O_4)_3 \cdot 8H_2O$  (?  $10H_2O$ )

100 cc. aq. 20% methylamine oxalate dissolve approx 4.082 gms. thulium oxalate.

100 cc. aq. 20% ethylamine oxalate dissolve approx. 5.728 gms. thulium oxalate.

100 cc. aq. 20% triethylamine oxalate dissolve approx. 1.340 gms. thulium oxalate. (Grant and James, 1917.)

THULIUM BROMONITROBENZENE SULFONATE  $Tm(C_6H_3Br.NO_2.SO_3, 1.4.2)_3 \cdot 12H_2O$ 

100 gms. sat. solution in water contain 6.379 gms. of the anhydrous salt at 25°. (Katz and James, 1913.)

## U URANIUM

## U URANIUM

The percentage solubility of uranium in mercury at 20°, determined by filtering an amalgam of the metal through a sintered glass filter, was found by Irvin and Russell, 1932, to be less than  $1 \times 10^{-5}$ .

Less than 0.05 wt. % uranium dissolves in metallic sodium at 97.8°. (Douglas, 1954.)

## AsO URANIUM DOUBLE ARSENATES

### SOLUBILITY PRODUCT CONSTANTS (Chukhlantsev and Sharova, 1956)

Measurements made in dilute  $H_2SO_4 + HNO_3$  at pH 2.05 - 5.30.

				Ksp
$[UO_2^{++}]$	$[NH_4^+]$	$[AsO_4^{=}]$	=	$1.71 \times 10^{-24}$
$[UO_2^{++}]$	$[K^+]$	$[AsO_4^{=}]$	=	$2.52 \times 10^{-23}$
$[UO_2^{++}]$	$[Na^+]$	$[AsO_4^{=}]$	=	$1.35 \times 10^{-22}$
$[UO_2^{++}]$	$[Li^+]$	$[AsO_4^{=}]$	=	$1.52 \times 10^{-19}$
$[UO_2^{++}]$	$[HAsO_4^{-}]$		=	$3.17 \times 10^{-11}$

## CH URANYL FORMATE $UO_2(HCOO)_2$

### SOLUBILITY IN WATER

(Solid phase is a monohydrate)

15° 7.2 gms.  $UO_2(HCOO)_2$  per 100 cc. sat. sol. (Courtois, 1914)

### SOLUBILITY OF URANYL FORMATE IN AQUEOUS SOLUTIONS OF FORMIC ACID AT 25° (Colani, 1929)

The solutions were kept in darkness during the period of saturation. When uranyl formate is dissolved in water or dilute solutions of formic acid, a precipitate of basic formate separates after a short time. This increases in solubility with increase in concentration of formic acid until the neutral formate is formed. This latter then decreases in solubility with increase in the concentration of formic acid.

SOLUBILITY OF URANYL FORMATE IN AQUEOUS SOLUTIONS OF  
FORMIC ACID AT 25°---Cont.

Gms. per 100 gms. sat. sol.		Solid Phase	Gms. per 100 gms. sat. sol.		Solid Phase

(1) This results corresponds to 7.24 gm. UO<sub>2</sub>(CH<sub>3</sub>COO)<sub>2</sub>·2H<sub>2</sub>O and 0.39 gm. free acetic acid per 100 gms. sat. solution.

# U URANIUM

## CH URANYL PROPIONATE, BUTYRATE, VALERATE

SOLUBILITY OF EACH SEPARATELY IN WATER  
(Courtois, 1914)

		t°	Gms. Anhydrous Cmpd. per liter sat. sol.
Uranyl Formate	$\text{UO}_2(\text{HCOO})_2 \cdot \text{H}_2\text{O}$	15	72.0
Uranyl Acetate	$\text{UO}_2(\text{CH}_3\text{COO})_2 \cdot 2\text{H}_2\text{O}$	17	77.3
Uranyl Propionate	$\text{UO}_2(\text{C}_2\text{H}_5\text{COO})_2 \cdot 2\text{H}_2\text{O}$	19	84.8
Uranyl <u>n</u> Butyrate	$\text{UO}_2(\text{C}_3\text{H}_7\text{COO})_2 \cdot 2\text{H}_2\text{O}$	17	105.3
Uranyl Iso "	"	20	42.5
Uranyl <u>n</u> Valerate	$\text{UO}_2(\text{C}_4\text{H}_9\text{COO})_2 \cdot 2\text{H}_2\text{O}$	14	37.2

100 gms. methyl alcohol dissolve 0.74 gm. anhydrous uranyl acetate at 15° and 0.83 gm. at 66° (b.pt.).

100 gms. acetone dissolve 2.37 gms. anhydrous uranyl acetate at 15°. (Henstock, 1934.)

100 gms. aq. solution contain 16.48 gms.  $2\text{UO}_2(\text{C}_3\text{H}_5\text{O}_2)_2 \cdot \text{NH}_4\text{C}_3\text{H}_5\text{O}_2$  at 29.8°.

100 gms. aq. solution contain 2.362 gms.  $\text{UO}_2(\text{C}_3\text{H}_5\text{O}_2)_2 + 0.82$  gm.  $\text{KC}_3\text{H}_5\text{O}_2$  at 29.4°, atomic relation, 1:1.29. (Rimbach, 1904.)

The double salt is decomposed by water at ordinary temperatures and the solution gets richer in uranyl butyrate. The solubility at 29.4° in water containing  $\text{KC}_4\text{H}_7\text{O}_2$  is 2.10 gms.  $\text{UO}_2(\text{C}_4\text{H}_7\text{O}_2)_2 + 0.38$  gm.  $\text{KC}_4\text{H}_7\text{O}_2$  per 100 gms. solution. The atomic relation being 1:0.64. (Rimbach, 1904.)

1000 cc.  $\text{H}_2\text{O}$  dissolve 0.30 gm. hydrated uranium helianthate at 20-25°. (Stark and Dehn, 1918.)

Data for the extraction of  $\text{UO}_2^{++}$  from aqueous solutions containing various organic compounds have been reported:

Organic Compound	Solvent System (+ $\text{H}_2\text{O}$ )	t°	Reference	
0-hydroxybenzoic acid 3,5-dinitrobenzoic acid cinnamic acid	methyl isobutyl ketone chloroform	25	Hok-Bernstrom, 1956	
acetylacetone	benzene	25	Rydberg and Rydberg, 1955	
0-hydroxybenzoic acid methoxybenzoic acid,	hexone	25	Hok-Bernstrom 1956a	
5,7-dichloro, 5,7-dibromo, 5,7-diiodo, 5 chloro-7-iodo 8-hydroxyquinolates	chloroform	25	Dyrssen, Dyrssen and Johansson, 1956	CH
cupferron	ether	--	Furman, Mason and Pekola, 1949	
cupferron 8 hydroxyquinoline	chloroform, hexone	--	Dyrssen and Dahlberg, 1953	

In a saturated solution in dioxane, the mole fraction of uranium 8-hydroxyquinolate is 0.00051. (Charles and Freiser, 1951.)

#### URANYL FERROCYANIDE $(\text{UO}_2)_2\text{Fe}(\text{CN})_6$

CN

A saturated solution in water contains  $8.0 \times 10^{-5}$  gm. ions  $\text{UO}_2^{++}$ . (Tananaev, Glushkova and Seifer, 1956.)

#### URANYL CARBONATE $\text{UO}_2\text{CO}_3$

CO

#### SOLUBILITY IN SODIUM CARBONATE SOLUTIONS AT 26° (Blake, et al., 1956)

Solid phase  $\text{UO}_2\text{CO}_3$

Moles per liter sat. sol.

Moles per liter sat. sol.

$\text{Na}_2\text{CO}_3$	$\text{UO}_2\text{CO}_3$	$d_{25}^\circ$	$\text{Na}_2\text{CO}_3$	$\text{UO}_2\text{CO}_3$	$d_{25}^\circ$

# U URANIUM

## CO URANYL AMMONIUM CARBONATE $\text{UO}_2\text{CO}_3 \cdot 2(\text{NH}_4)_2\text{CO}_3$

### SOLUBILITY IN WATER (Girolitti and Vecchiarelli, 1905)

A large excess of the double carbonate was agitated with water at constant temperature and the clear saturated solutions analyzed.

t°	Gms. per 100 Gms. Sat. Sol.			Mol. Ratio		
	U	CO <sub>2</sub>	NH <sub>3</sub>	U	CO <sub>2</sub>	NH <sub>3</sub>
18.6	2.71	1.54	0.795	1	3.08	4.10
36.5	3.09	2.29	1.188	1	4.01	5.35
48.3	3.03	2.71	1.35	1	4.95	6.35
62	-	3.17	1.62	-	-	-
87.3	3.95	3.96	2.027	1	5.42	7.15

Theoretical molecular ratio for  $\text{UO}_2\text{CO}_3 \cdot 2(\text{NH}_4)_2\text{CO}_3 = 1:3:4$ .

Thus at the lower temperature, the composition of the dissolved salt is very near the ratio corresponding to the formula.

The author calculates that 6.04 gms. of  $\text{UO}_2\text{CO}_3 \cdot 2(\text{NH}_4)_2\text{CO}_3$  are contained in 100 gms. of the sat. solution at 18.6° (a recalculation from the U value, 2.71, indicates that this figure should be 5.26 gms.).

## URANYL CAMPHO CARBONATE $\text{UO}_2(\text{C}_{11}\text{H}_{15}\text{O}_3)_2$

### SOLUBILITY OF URANYL CAMPHO CARBONATE IN SEVERAL SOLVENTS (Picon, 1931)

## URANYL SODIUM CHROMATE 2(UO<sub>3</sub>)CrO<sub>4</sub>·Na<sub>2</sub>CrO<sub>4</sub>·10H<sub>2</sub>O

100 gms. sat. aqueous solution contain 52.52 gms. 2(UO<sub>2</sub>)CrO<sub>4</sub>Na<sub>2</sub>CrO<sub>4</sub> at 20°. (Rimbach, 1904.)

## F URANYL FLUORIDE UO<sub>2</sub>F<sub>2</sub>

The system UO<sub>2</sub>F<sub>2</sub> - H<sub>2</sub>O is shown graphically by Marshall, Gill and Secoy 1954. A saturated solution at the eutectic ~-14° contains about 64% UO<sub>2</sub>F<sub>2</sub> with UO<sub>2</sub>F<sub>2</sub>·2H<sub>2</sub>O the saturating phase. The solubility increases to about 73% at 100°. β and γ forms of the dihydrate are formed at higher temperatures.

### FREEZING POINTS OF UO<sub>2</sub>F<sub>2</sub> IN WATER (Johnson and Kraus, 1952)

0.6943	1.058	3.427	5.812	5.249	10.183
1.341	2.003				

Data for the extraction of UO<sub>2</sub><sup>++</sup> from aqueous HF solutions at 20° by ethyl ether are given by Bock and Herrmann, 1956.

## URANYL DOUBLE FLUORIDES WITH ORGANIC BASES

F

SOLUBILITY OF EACH SEPARATELY IN WATER AT 20°  
(Olsson, 1930)

Organic Base		Gms. Compound per 100 cc sat. sol.
Pyridine	$C_5H_5NHUO_2F_3 \cdot H_2O$	1.289
Pyridine	$C_5H_5NH(UO_2)_2F_3 \cdot 3H_2O$	1.952
Quinoline	$C_9H_7NHUO_2F_3 \cdot H_2O$	0.126
Quinoline	$C_9H_7NH(UO_3)_2F_3 \cdot 2H_2O$	0.979
Tetra Methyl Ammonium	$(CH_3)_4N(UO_2)_2F_3 \cdot 2H_2O$	0.143
Tetra Ethyl Ammonium	$(C_2H_5)_4NUO_2F_3$	0.716
Tetra Ethyl Ammonium	$(C_2H_5)_4N(UO_2)_2F_3 \cdot 2H_2O$	0.771
Tri methyl -p- Toly Ammonium	$C_6H_4CH_3(CH_3)_3NUO_2 \cdot 2H_2O$	1.645
Tri methyl -p- Toly Ammonium	$C_6H_4CH_3(CH_3)_3N(UO_2)_2F_3 \cdot H_2O$	3.091
Tri methyl pyridine	$C_5H_2(CH_3)_3NH(UO_2)_3F_7 \cdot 6H_2O$	0.708
Di ethyl aniline	$C_6H_5N(C_2H_5)_2H(UO_2)_2F_3 \cdot 2H_2O$	1.759
Di ethyl aniline	$C_6H_5N(C_2H_5)_2H(UO_2)_2F_3 \cdot H_2O$	3.896
Tri ethyl sulfine	$(C_2H_5)_3S(UO_2)_2F_3 \cdot 2H_2O$	0.897

URANIUM TRIFLUORIDE  $UF_3$ 

Melting points for the systems  $UF_3 + BaF_2$ ,  $UF_3 + SrF_2$  and  
 $UF_3 - BaCl_2$  are given by D'Eye and Martin, 1956, 1957

URANIUM TETRAFLUORIDE  $UF_4$ 

For the system  $UF_4 - LiF$  see Barton, et al., 1958.

URANIUM HEXAFLUORIDE  $UF_6$ 

Data are given for the systems:

$UF_6 + HF$	(Bullard, Ostroski and Stringham, 1957)
$UF_6 + Br_2$	(Fischer and Vogel, 1954a)
$UF_6 + BrF_3$	(Fischer and Vogel, 1954)
$UF_6 + BrF_5$	(Fischer and Vogel, 1954)
$UF_6 + ClF_6$	(Wendolkowski and Barber, 1958)

# U URANIUM

## 10 URANYL IODATE $\text{UO}_2(\text{IO}_3)_2$

SOLUBILITY OF THE DIFFERENT CRYSTALLINE FORMS IN WATER AT 18°  
(Artmann, 1912-13)

		Gms. $\text{UO}_2(\text{IO}_3)_2$ per 100 Gms. $\text{H}_2\text{O}$
$\text{UO}_2(\text{IO}_3)_2 \cdot \text{H}_2\text{O}$	Type I warty, later prismatic needles	0.1049
$\text{UO}_2(\text{IO}_3)_2 \cdot \text{H}_2\text{O}$	Type II pyramids, sphenoids	0.1214
$\text{UO}_2(\text{IO}_3)_2 \cdot 2\text{H}_2\text{O}$		0.2044

## NO URANYL NITRATE $\text{UO}_2(\text{NO}_3)_2$

### THE SYSTEM URANYL NITRATE - WATER

(Below 70°--Wasilieff, 1910; Guempel, 1929. Above 70°--Marshall, Gill and Secoy, 1951; Benrath, 1942.)

From the eutectic to +10° the data of Wasilieff and of Guempel agree well (G. up to 0.5% higher). From about 15° to 35° Guempel's data are about 1% lower. The solubility curve for the hexahydrate is S-shaped with an inflection point at about +5°. Guempel's data are given in column I. Figures in parentheses are interpolated from Wasilieff. Above 60° Marshall's and Benrath's data are in agreement, but Marshall's lie on a smoother curve. (In this temperature range Guempel's and Wasilieff's results are up to 2% too high.) Column II is taken from Marshall.

<sup>a</sup>Saturated with UO<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>ODISTRIBUTION OF URANYL NITRATE BETWEEN ETHER AND NITRIC ACID  
SOLUTIONS AT 20°  
(Norstrom and Sillen, 1948)

At least two determinations of the concentrations of uranium were made at each acid strength. Only one of these is listed below, and the values for "Q", the ratio of the amounts of U<sub>3</sub>O<sub>8</sub> in equal volumes of each phase, indicate the variation found at each concentration.

Additional data which are in good agreement with those of Norstrom and Sillen are given by Juttner, 1901; Bogden, 1905; 1906; Pavlov, 1924; and Archibald, 1932.

## SOLUBILITY OF URANYL NITRATE IN ETHER (Bachelet and Cheylan, 1947)

Although the solubility curve drawn by them shows no breaks, the authors report the formation of two etherates upon evaporation:  $\text{UO}_2(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O} \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$ , M.P. 45° and  $\text{UO}_2(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O} \cdot 4(\text{C}_2\text{H}_5)_2\text{O}$ , M.P. 2.2°. The following data were read from the authors' rather rough curve.

Temperature°:	-80	-40	-20	0	20	40
Gms. $\text{UO}_2(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ per 100 gms. ether:	10	22	50	88	127	175

## SOLUBILITY OF URANYL NITRATE ETHERATES IN ETHER (Vdovenko, Koval'skaya and Kovaleva, 1957)

$\text{UO}_2(\text{NO}_3)_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$ (soly. 5.3 g U per 100 g sat. solu in ether at 15°)						
$\text{UO}_2(\text{NO}_3)_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O} \cdot 2\text{H}_2\text{O}$ (soly. 31.8 g U	"	"	"	"	"	"

## SOLUBILITY OF URANYL NITRATE IN ORGANIC SOLVENTS AT 20° (Yaffe, 1949)

Each solvent was shaken with  $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  from one to four days. The salt was then extracted from the solution with water and determined colorimetrically. A large number of other solvents were used in which the solubility was "less than 0.1 gms. per 100 ml."

## PO URANYL PHOSPHATES

### SOLUBILITY IN PHOSPHORIC ACID SOLUTIONS (Schreyer and Baes, Jr., 1954, 1955)

Three phases were found  $(\text{UO}_2)_3(\text{PO}_4)_2 \cdot 6\text{H}_2\text{O}$  in solutions containing less than 0.014 M total  $\text{PO}_4^{3-}$ ,  $\text{UO}_2\text{HPO}_4 \cdot 4\text{H}_2\text{O}$  when  $\text{PO}_4^{3-}$  is between 0.014 and 6.1 M, and  $\text{UO}_2(\text{H}_2\text{PO}_4)_2 \cdot 3\text{H}_2\text{O}$  when  $\text{PO}_4^{3-}$  is greater than 6.1 M. The results are given graphically. In the latter paper results in aq  $\text{HClO}_4$  solutions are also given.

## PO URANYL DOUBLE PHOSPHATES

Salt	Ksp	
$\text{UO}_2\text{HPO}_4$	$2.14 \times 10^{-11}$	
$\text{UO}_2\text{KPO}_4$	$7.76 \times 10^{-24}$	
$\text{UO}_2\text{NH}_4\text{PO}_4$	$4.36 \times 10^{-27}$	(Chukhlantsev and Stepanov, 1956)

## PO URANIUM PHOSPHATES

VANADIUM (V) SULFATES  $(V_2O_5)_x(SO_3)_y$ 

50

THE SYSTEM  $V_2O_5 - SO_3 - H_2O$   
(Marakov and Repa, 1938; Lanford and Kiehl, 1940)

At 25° and 75°, Marakov and Repa found four stable solid phases, none of which contained  $SO_3$ . At 30° however, Lanford and Kiehl found that three of the solids were hydrated compounds of  $SO_3 + V_2O_5$ . The later authors do not mention the data of Marakov and Repa, although the general shape of the solubility curves are the same in each case, it is hard to tell which data and solid phases represent the true equilibrium. Marakov's data may also be found in the article by Marakov and Repa (1940) on the system  $Na_2O - SO_3 - V_2O_5 - H_2O$ .

Xe XENON

Xe XENON

#### SOLUBILITY OF XENON IN WATER

Morrison and Johnstone, 1954 determined the solubility in a special apparatus that assured equilibrium between liquid and vapor. The results are lower (especially at higher temperatures) than previously published values. They are internally consistent and are considered reliable:

( $\beta$  = cc Xe, measured at 0°, 760 ml, per cc H<sub>2</sub>O)

t°	$\beta$	t°	$\beta$	t°	$\beta$
12.7	0.1355	30.2	0.0845	47.9	0.0594
15.1	0.1236	40.0	0.0693	59.0	0.0508
15.5	0.1211	40.5	0.0678	71.7	0.0438
19.6	0.1109				

(Earlier Values of von Antropoff, 1909-10)

The results are in terms of the coef. of absorption  $\beta$ , as defined by Bunsen and modified by Kuenen in respect to the substitution of mass for volume of water.

t°	0°	10°	20°	30°	40°	50°
Abs. Coef. $\beta$	0.2180	0.1500	0.1109	0.0900	0.0812	0.0878

Other (high) values are reported by Valentiner, 1927, 1930.

#### SOLUBILITY OF XENON IN AQUEOUS SALT SOLUTIONS (Eucken and Hertzberg, 1950)

At 0°		At 20°	
Moles NaCl per 1000 Gms. H <sub>2</sub> O	$\beta$	Moles NaCl per 1000 Gms. H <sub>2</sub> O	$\beta$
0	0.222	0	0.1107
0.76	0.1595	0.285	0.0990
1.17	0.1323	1.32	0.0661
2.68	0.0719	1.80	0.0564

In aqueous NaCl solutions, Morrison and Johnstone, 1955 report a salting-out coefficient of 0.149 at 25°, and 0.113 in aqueous KI.

$$k = \frac{\log S_0/S}{C}, \quad \text{where } S_0 \text{ is soly. in water, } C \text{ is in moles/1000 gms. H}_2\text{O}.$$

SOLUBILITY OF XENON IN WATER AND IN ANILINE  
(Antropoff, 1919)

The determinations were made with the highest accuracy possible. An apparatus was used in which the solvent and its vapor touched no cock. The results are expressed in terms of the Bunsen absorption coefficient  $\beta$ , as modified by Kuenen. They show the volume of xenon in cubic centimeters (reduced to 0° and 760 mm.) dissolved by one gram of solvent. However, the values in water are high.

Coef. of absorption $\beta$ in			Coef. of absorption $\beta$ in		
t°	Water	Aniline	t°	Water	Aniline
0	0.242	-	30	0.098	0.455

## Xe XENON

Data for the solubility of xenon in CCl<sub>4</sub> are reported by Kay and Penneman, 1955.

In olive oil,  $\beta = 1.9$  at 22° and 1.7 at 37°. (Loomis, 1946)

### SOLUBILITY OF XENON IN LIQUID OXYGEN (v. Stackelberg, 1934)

In determination of the saturation point was made by means of vapor pressure measurements.

t°	Mol. Xe per 1.0 mol. Xe + O
70	0.141
80	0.217
90	0.304

Data for the solubility of Xe in liquid N<sub>2</sub>, He and H<sub>2</sub> are given by Ewald, 1955.

Data for systems of Xe with Diborane, Trimethylboron, SO<sub>2</sub>, H<sub>2</sub>S, methylether, methyl alcohol and BF<sub>3</sub> are given by Wiber, and Karbe, 1948.

## Y YTTRIUM BROMIDE YBr<sub>3</sub>

### SOLUBILITY OF YTTRIUM BROMIDE IN WATER (Crew, Stewart and Hopkins, 1925)

The solutions were saturated by frequent agitation during 5 hours and equilibrium was approached from above and from below.

t°	Gms. YBr <sub>3</sub> per 100 gms. H <sub>2</sub> O	t°	Gms. YBr <sub>3</sub> per 100 gms. H <sub>2</sub> O

## CM YTTRIUM COBALTICYANIDE $Y_2(CoC_6N_6)_2 \cdot 8H_2O$

1000 gms. aq. 10% HCl ( $d_{15} = 1.05$ ) dissolve 2.78 gms. of the salt at 25°. (James and Willand, 1916.)

## YTTRIUM FERROCYANIDES

Salt.	Soly. in water at 25° moles per liter
$Y_6K_4 [Fe(CN)_6]_7 \cdot 30H_2O$	$6.2 \times 10^{-6}$
$YRb [Fe(CN)_6] \cdot 2H_2O$	$1.8 \times 10^{-4}$
$YCs [Fe(CN)_6] \cdot 2H_2O$	$5.2 \times 10^{-5}$

YTTRIUM OXALATE  $Y_2(C_2O_4)_3 \cdot 9H_2O$ 

CO

One liter  $H_2O$  dissolves 0.001 gm.  $Y_2(C_2O_4)_3$  at  $25^\circ$ , determined by the electrolytic method. (Rimbach and Schubert, 1909.)

100 gms. aqueous ammonium oxalate solution (3.26%  $(NH_4)_2C_2O_4 \cdot H_2O$ ) dissolve 0.01714 gm.  $Y_2(C_2O_4)_3 \cdot 9H_2O$  at room temp. (Cleve, 1902.)

100 gms. aq. 2.16  $N H_2SO_4$  dissolve 0.6884 gm.  $Y_2(C_2O_4)_3$  at  $25^\circ$ . (Wirth, 1932.)

100 gms. aq. 4.32  $N H_2SO_4$  dissolve 1.4 gms.  $Y_2(C_2O_4)_3$  at  $25^\circ$ . (Wirth, 1932.)

100 cc. aq. 20% methylamine oxalate dissolve 0.877 gm. yttrium oxalate at ord. temp.

100 cc. aq. 20% ethylamine oxalate dissolve 1.653 gms. yttrium oxalate at ord. temp.

100 cc. aq. 20% triethylamine oxalate dissolve 1.006 gms. yttrium oxalate at ord. temp. (Grant and James, 1917.)

YTTRIUM POTASSIUM OXALATE  $Y_2(C_2O_4)_3 \cdot 4K_2C_2O_4 \cdot 12H_2O$ SOLUBILITY IN WATER AT  $25^\circ$ 

(Pratt and James, 1911)

The determinations were made with great care. The mixtures were constantly rotated for 8 weeks.

100 cc. of water, saturated with HCl at 0° (1 atm.) contain 0.024 gms. Y<sub>2</sub>O<sub>3</sub>. Fischer, W., and Z.-Pf., 1949

100 cc. of a mixture of equal volumes of ether and water, saturated with HCl at 0° (1 atm) contain 0.0015 gms. Y<sub>2</sub>O<sub>3</sub>. (Fischer, W., and Z.-Pf., 1949.)

100 gms. alcohol dissolve 61.1 gms. YCl<sub>3</sub> at 15°. (Matignon, 1906.)

100 gms. alcohol dissolve 60.5 gms. YCl<sub>3</sub> at 20°. (Matignon, 1909.)

100 gms. pyridine dissolve 6.5 gms. YCl<sub>3</sub> at 15°. (Matignon, 1906.)

YTTRIUM HEXAANTIPYRINE PERCHLORATE  $Y(COC_{10}H_{12}N_2)_6(ClO_4)_3$  ClO

100 cc sat. solution of the salt in water contain 0.55 gm.  
 $Y(COC_{10}H_{12}N_2)_6(ClO_4)_3$  at 20°. (Wilke-Dörfurt and Schliephake, 1928.)

YTTRIUM HEXAANTIPYRINE IODIDE  $Y(COC_{10}H_{12}N_2)_6I_3$  I

100 cc sat. solution of the salt in water contain 4.44 gm.  
 $Y(COC_{10}H_{12}N_2)_6O_3$  at 20°. (Wilke-Dörfurt and Schliephake, 1928.)

YTTRIUM IODATE  $Y(IO_3)_3 \cdot 3H_2O$  10

100 gms.  $H_2O$  dissolve 0.53 gm. yttrium iodate. (Berlin.)

YTTRIUM NITRATE  $Y(NO_3)_3$  NO

SOLUBILITY OF YTTRIUM NITRATE IN WATER  
 (Crew, Steinert and Hopkins, 1925)

Saturation was obtained by frequent agitation during 5 hours and approaching equilibrium from above and from below.

t°	Gms. $Y(NO_3)_3$ per 100 gms. $H_2O$	t°	Gms. $Y(NO_3)_3$ per 100 gms. $H_2O$
0.0	93.1	60.2	200.0
22.5	134.5	66.5	211.0
35.0	155.0		

Data for the distribution of  $Y(NO_3)_3$  between tributyl phosphate and water is given by Healy and McKay, 1956.

100 cc of a sat. solution of yttrium nitrate in ethyl ether prepared by frequent agitation and allowing to stand over night at about 20°, contain 0.792 gm.  $Y_2O_3$ . A saturated ethereal solution prepared as above but using yttrium nitrate dehydrated at 150°, contains 0.803 gm.  $Y_2O_3$  per 100 cc. - (Wells, 1930.)

When a mixture of rare earth nitrates containing 10%  $Y(NO_3)_3$  is shaken with n-hexyl ketone and water at room temperature the distribution ratio was found to be less than 0.0012, with 33.0% of the anhydrous nitrates in the aqueous phase (Rothschild, Templeton, and Hall, 1948.)

The solubility of a mixture of rare earth nitrates containing 23%  $Y(NO_3)_3$  was found to be 12.0 gms. of anhydrous nitrates per 100 gms. of saturated solution in isoamyl alcohol and 3.22 gms. per 100 gms. saturated solution in methyl n-hexyl ketone at room temperature. (Rothschild, Templeton, and Hall, 1948.)

# Y YTTRIUM

## NO YTTRIUM BASIC NITRATE $3Y_2O_3 \cdot 4N_2O_5 \cdot 2H_2O$

THE SYSTEM YTTRIUM NITRATE - YTTRIUM HYDROXIDE - WATER AT 25°  
(James and Pratt, 1910)

The determinations were made with very great care. The mixtures were rotated  $4\frac{1}{2}$  months.

$d_{25}$ of Sat. Sol.	Gms. per 100 Gms. $H_2O$		Solid Phase

## O YTTRIUM OXIDE $Y_2O_3$

## OH YTTRIUM HYDROXIDE $Y(OH)_3$

Oka, 1940 found the solubility of  $Y(OH)_3$  to be  $1.8 \times 10^{-6}$  moles per liter by potentiometric titration. Moeller and Kremers (1944) found  $1.2 \times 10^{-6}$  moles/l. and Moeller and Fogel (1950),  $0.9 \times 10^{-6}$  moles/liter (25°).

One liter sat. solution of yttrium oxide in water contain 0.000008 gm. mol.  $Y_2O_3$  at 29° as determined by electrometric titration. (Busch, 1927.)

The Ksp of  $Y(OH)_3$  is  $1 \times 10^{-24}$  (Korenman, 1955)

Data for the precipitation of  $Y_2O_3$  and other rare earth oxides from ammonium acetate solutions ARE given by Perey, 1949.

## Zn ZINC

## Zn ZINC

### SOLUBILITY IN WATER AT 25° (Pariaud and Archinard, 1952)

Degassed, triply distilled water at pH 7.0 was used. The metal was electrolytically pure. An average of 6 closely agreeing determinations equilibrated for 17 and 32 days showed 0.710 mg per liter. Dithizone was used for analysis.

### SOLUBILITY OF ZINC IN AQUEOUS POTASSIUM CYANIDE SOLUTIONS (White, 1919)

The weight of zinc dissolved per 24 hours from rectangular (2.5 x 1.5 cm.) pieces of ordinary commercial rolled sheet zinc 0.03 mm. in thickness, when suspended in aqueous potassium cyanide solutions, was determined. Uniform conditions were maintained in each experiment but the temperature was not held constant. The influence of oxygen concentration, cyanide concentration, alkalinity, etc. was studied. The main reaction in presence of oxygen is

Therefore, 6.0 milligrams of oxygen per liter is equivalent to 0.0089 per cent KCN and to 24.5 milligrams of Zn per liter. However, in the absence of oxygen some zinc may dissolve. Numerous tables and curves are given.

### SOLUBILITY OF ZINC IN MILK (Quam, 1929)

Highly polished 4 x 7.5 cm. strips of zinc were each immersed in 50 cc portions of raw milk and rocked 46 times per minute for 30 minutes. The loss in weight of the Zn strips was determined and the results expressed in mgs. Zn dissolved per sq. decimeter of surface exposed.

t°	Mgs. Zn dissolved per sq. cm.	t°	Mgs. Zn dissolved per sq. cm.
30	0.432	75	1.78
40	0.744	85	1.546
50	1.03	95	1.03
60	1.546		

Data for the system  $\text{Zn} + \text{CuCl}_2 = \text{ZnCl}_2 + \text{Cu}$  are reported by Palkin and Chepurko, 1956.

For the system Zn - Ga see Genta, 1955.

## AsO ZINC ARSENITE $\text{Zn}_3(\text{AsO}_3)_2$

The Ksp is  $2.8 \times 10^{-20}$  at 20°, as determined in  $\text{HNO}_3$ ,  $\text{HCl}$ , and  $\text{H}_2\text{SO}_4$  solutions. (Chukhlantsev, 1957.)

Data for the solubility of zinc arsenites in dil.  $\text{NH}_3$  and acetic acid solutions at  $25^\circ$  and  $70^\circ$  are given by Kuperman, Orlov, Krutitskaya and Trushkina, 1955.

100 gms. 95% formic acid dissolve 0.86 gms.  $\text{Zn}_3(\text{AsO}_3)_2$  at  $21^\circ$ . (Aschan, 1913.)

ZINC ARSENATE  $\text{Zn}_3(\text{AsO}_4)_2$ 

AsO

THE SYSTEM ZINC OXIDE - ARSENIC PENTOXIDE - WATER AT  $30^\circ$   
(Takahashi and Sasaki, 1953)

Point C occurs in a solution containing 61.92%  $\text{As}_2\text{O}_5$ .

## Zn ZINC

Chuklantsev, 1956 reports the solubility product constant  $[Zn]^3 [AsO_4]^2$  to be  $1.3 \times 10^{-38}$  by acid solubility measurements and  $1.08 \times 10^{-37}$  from radiotracer determinations. Other data in dil  $NH_3$  and acetic acid solutions at 25° and 70° are reported by Kuperman, Orlov, Krutitskaya and Trushkina, 1955.

100 gms. 95% formic acid dissolve 0.26 gm.  $Zn_3(AsO_4)_2$  at 21°. (Aschan, 1913.)

## AsO ZINC CACODYLATE $Zn[(CH_3)_2AsOO]_2 \cdot 7H_2O$

### SOLUBILITY OF ZINC CACODYLATE IN WATER (Tiollis and Perdreau, 1939)

t°	Gms. $Zn[(CH_3)_2AsOO]_2$ per 100 gms. sat. sol.	Solid Phase

### SOLUBILITY OF ZINC BENZOATE IN SEVERAL SOLVENTS (Henstock, 1934)

Solvent	t°	Gms. $\text{Zn}(\text{C}_6\text{H}_5\text{COO})_2$ per 100 gms. solvent
Methyl Alcohol	15	9.90
Methyl Alcohol	65.9 (b.pt.)	6.62
Acetone	15	1.00
Benzene	15	4.20

## ZINC BENZOATE, CHLORO, NITRO, OXY, BENZOATES

### SOLUBILITY OF EACH SEPARATELY IN WATER AT 20° (Ephraim and Pfister, 1925)

	Gms. anhydrous compound per 100 cc. sat. sol.
Zinc Benzoate $\text{Zn}(\text{C}_6\text{H}_5\text{COO})_2 \cdot \text{H}_2\text{O}$	2.048
Zinc 4-Chloro Benzoate $\text{Zn}(\text{C}_6\text{H}_4\text{ClCOO})_2 \cdot 2\text{H}_2\text{O}$	0.649
Zinc 4-Methoxy Benzoate $\text{Zn}(\text{C}_6\text{H}_4\text{OCH}_3\text{COO})_2 \cdot \text{H}_2\text{O}$	1.174
Zinc 4-Nitro Benzoate $\text{Zn}(\text{C}_6\text{H}_4\text{NO}_2\text{COO})_2 \cdot 2\text{H}_2\text{O}$	0.556
Zinc 4-Oxy Benzoate $\text{Zn}(\text{C}_6\text{H}_4\text{OHCOO})_2 \cdot 8\text{H}_2\text{O}$	1.687

## ZINC NITROSO $\beta$ PHENYL HYDROXYLAMINE $\text{Zn}[\text{C}_6\text{H}_5 \cdot \text{N}(\text{NO}) \cdot \text{O}]_2$

One liter sat. solution in water contains 0.00049 gm. at = 0.032 gm Zn at 18°. (Pinkus and Martin, 1927.)

## ZINC TETRACHLOROPHTHALATE $\text{Zn}[\text{C}_6\text{Cl}_4(\text{COO})_2]$

100 gms. of a saturated solution in water at 25° contain 3.0 gms. of the Salt. 100 gms. of a saturated solution in water at 75° contain 2.0 gms. of the Salt. (Lawlor, 1947)

ZINC CINNAMATE  $\text{Zn}(\text{C}_9\text{H}_7\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$ 

CH

100 cc. sat. solution of zinc cinnamate in water contain 0.15 gm.  $\text{Zn}(\text{C}_9\text{H}_7\text{O}_2)_2$  at 20°. (Ephraim, and Pfister, 1925.)

100 cc. sat. solution in water contain 0.144 gm. zinc cinnamate at 26.5°. (De Jong, 1909.)

## ZINC 8-HYDROXYQUINOLATES

The Ksp of zinc oxine is  $3.73 \times 10^{-21}$  (Tinovskaya, 1950);  $3.2 \times 10^{-26}$  (Borrel and Paris, 1952). See also Weber, 1953.

The Ksp of zinc 2-methyl 8-hydroxyquinolate is  $10^{-26}$  (Borrel and Paris, 1952) See also Weber, 1953

Data for the Ksp of zinc 8-hydroxy quinoline - 5 - sulfonate at 25° are given by Nasanen and Uusitalo, 1954. Ksp data for the 5,7 dibromo 8-hydroxyquinoline derivative is given by Weber, 1953. For the 5-chloro -7-iodo 8 hydroxy quinolate see Recktenwald, 1955

ZINC DIPHENYL  $\text{Zn}(\text{C}_6\text{H}_5)_2$ SOLUBILITIES AT 20°  
(Strohmeier, 1955)

Heptane	4.2	gms. per liter
Benzene	79	gms. per liter
Dioxane	159	gms. per liter

ZINC ANTIPYRINE SALTS  $\text{Zn}(\text{C}_{11}\text{H}_{12}\text{N}_2\text{O})_2 \cdot \lambda_2$ 

## Results of Kumov, 1951

	Gms. Salt at 15° per 100 ml solvent		
	water	ethanol	ethyl ether
zinc antipyrine bromide	2.10	0.48	0
zinc antipyrine thiocyanate	0.40 (0.33%) <sup>a</sup>	0.32	0.14
zinc antipyrine chloride	1.70	0.44	0.23
zinc antipyrine iodide	0.65	0.63	0.036

<sup>a</sup>Burkat, 1956. Burkat also found the double salt:  $[(\text{C}_{11}\text{H}_{12}\text{N}_2\text{O})_2\text{H}_2\text{Zn}(\text{SCN})_4] \cdot 2\text{C}_{11}\text{H}_{12}\text{N}_2\text{O}$  with a solubility in water of 0.07% at 15°.

## Zn ZINC

### ZINC CAMPHO CARBONATE $\text{Zn}(\text{C}_{11}\text{H}_{15}\text{O}_3)_2$

SOLUBILITY OF ZINC CAMPHO CARBONATE IN SEVERAL SOLVENTS AT 10°  
(Picon, 1931)

Solvent	Gms. $\text{Zn}(\text{C}_{11}\text{H}_{15}\text{O}_3)_2$ per liter sat. sol.
Water	4.0
Petroleum	373.3
Acetone	281.0
Olive oil	125.0 (15°)

When the compound is dissolved in boiling benzene and is then separated from this solvent and thus completely dehydrated, it becomes soluble to the extent of 500 gms. per liter in methyl alcohol, ethyl alcohol, benzene, chloroform, carbon tetrachloride, carbon disulfide and petroleum ether.

## Zn ZINC

### CH ZINC PHENOL SULFONATE

SOLUBILITY OF ZINC PHENOLSULFONATE,  $p$   $(C_6H_4 \cdot OH \cdot SO_3)_2 Zn \cdot 8H_2O$ , IN  
AQUEOUS ALCOHOL SOLUTIONS AT 25°  
(Seidell, 1910)

Wt. %			Gms.			Wt. %			Gms.		
$C_2H_5OH$	$d_{25}$		$(C_6H_4 \cdot OH \cdot SO_3)_2 Zn \cdot 8H_2O$			$C_2H_5OH$	$d_{25}$		$(C_6H_4 \cdot OH \cdot SO_3)_2 Zn \cdot 8H_2O$		
in	of		per			in	of		per		
Sol-	Sat.		100 Gms.			Sol-	Sat.		100 Gms.		
vent	Sol.	Sat.	Sol.			vent	Sol.	Sat.	Sol.		
0	1.185		39.8			80	1.057		40.7		
20	1.161		40.7			90	1.047		41.4		
40	1.139		42.1			92.3	1.048		41.9		
47	-		42.2			95	1.052		42.9		
60	1.106		41.6			100	1.075		48.8		

100 gms.  $H_2O$  dissolve 37 gms.  $(C_6H_4 \cdot OH \cdot SO_3)_2 Zn \cdot 8H_2O$  at 15° and  $d_{15}$  of sat. sol. = 1.162. (Greenish and Smith, 1902.)

### ZINC HELIANTHATE $Zn(C_{14}H_{14}N_3SO_3)_2 \cdot 4H_2O$

1000 cc.  $H_2O$  dissolve 0.098 gm. of the hydrated salt at 20-25°. (Stark and Dehn, 1918.)

### ZINC STEARATE

Data for the effect of small amounts of additives on the solution temperature of zinc stearate are reported by Chatterjee and Palit, 1954.

### CM ZINC CYANIDE $Zn(CN)_2$

One liter sat. solution of zinc cyanide in water contain 0.000049 gm. mol.  $Zn(CN)_2$  at 18°, as determined by E.M.F. measurements. (Masaki, 1931.)

100 cc. concentrated  $Zn(C_2H_3O_2)_2$  + Aq. dissolve 0.4 gm.  $Zn(CN)_2$ .

100 cc. concentrated  $ZnSO_4$  + Aq. dissolve 0.2 gm. (Joannis, 1882.)

### ZINC FERROCYANIDE $Zn_2Fe(CN)_6$

A saturated solution in water contains  $1.5 \times 10^{-5}$  gm. ions of zinc. (Tananaev, Glushkova and Seifer, 1956.)

The solubility of potassium zinc ferricyanide,  $K_2Zn_3[Fe(CN)_6]_2$  in water at 25° is  $1.2 \times 10^{-14}$  moles per liter. (Grieb and Cone, 1950.)

ZINC FERRICYANIDE  $\text{Zn}_3[\text{Fe}(\text{CN})_6]_2$ 

CN

The solubility in water is  $1.65 \times 10^{-4}$  moles per liter. (Grieb and Cone, 1950.)

ZINC THIOCYANATE  $\text{Zn}(\text{SCN})_2$ 

SCN

One liter sat. solution of zinc thiocyanate in water contains 0.144 gm. mol.  $\text{Zn}(\text{SCN})_2$  at  $18^\circ$ , as determined by E.M.F. measurements. (Masaki, 1931.)

100 gms. liquid sulfur dioxide dissolve 0.73 gm.  $\text{Zn}(\text{SCN})_2$  at  $0^\circ$ . (Jander and Ruppolt, 1937.)

100 gms.  $\text{H}_2\text{O}$  dissolve 0.24 gm. zinc mercuric thiocyanate,  $\text{ZnHg}(\text{CNS})_4$  at  $15^\circ$ . (Robertson, P. W., 1907.)

ZINC CARBONATE  $\text{ZnCO}_3$ 

CO

100 gms. of a sat. solution of  $\text{ZnCO}_3$  in water at  $18^\circ$  and in contact with  $\text{CO}_2$  at a pressure of 1 atmosphere contain 0.07 gm.  $\text{ZnCO}_3$ . At a pressure of 56 atmospheres of  $\text{CO}_2$  0.084 gm.  $\text{ZnCO}_3$  are dissolved. (Hachnel, 1924.)

Ageno and Valla (1911) report that the solubility of  $\text{ZnCO}_3$  in water at  $25^\circ$  is  $1.64 \cdot 10^{-4}$  mols. = 0.206 gm. per liter.

One liter of aq. 5.85% NaCl solution dissolves 0.0586 gm.  $\text{ZnCO}_3$  at  $14^\circ$ . One liter of aq. 7.45% NaCl solution dissolves 0.0477 gm.  $\text{ZnCO}_3$  at  $14^\circ$ . (Cantoni and Passamanik, 1905.)

"If zinc carbonate were not hydrolytically dissociated, its solubility in pure water at  $25^\circ$ , would be  $4.58 \times 10^{-6}$  gms. mols. per liter." (Smith, 1918.)

ZINC BICARBONATE  $\text{Zn}(\text{HCO}_3)_2$ 

SOLUBILITY OF ZINC BICARBONATE IN WATER CONTAINING CARBON DIOXIDE  
(Smith, H. J., 1918)

For description of the experimental method see iron bicarbonate, Vol I, p. 1010.

The calculated pressures are lower than the actual pressures since Henry's Law does not hold at very high pressures.

Results are also given for mixture of the oxychloride and oxide in aqueous zinc chloride solutions at various temperatures.

Data for equilibrium in the system zinc chloride, zinc oxide and water at 25° and at 50° are given by Holland, 1930. The results are presented according to Janecke's method and can only be converted to the weight basis by tedious calculations. The author failed to find the compound  $\text{ZnCl}_2 \cdot \text{ZnO} \cdot 1\frac{1}{2}\text{H}_2\text{O}$  reported by Driest. He obtained evidence for the existence of two new oxychlorides of zinc, namely,  $\text{ZnCl}_2 \cdot \text{ZnO} \cdot 2\text{H}_2\text{O}$  and  $\text{ZnCl}_2 \cdot \text{ZnO} \cdot \text{H}_2\text{O}$ . Of those formerly described only  $\text{ZnCl}_2 \cdot 5\text{ZnO} \cdot 8\text{H}_2\text{O}$  exists in stable equilibrium in the range of concentration of the present experiments.

Additional data on this system are given by Feitknecht, 1930. The results which are given only in the form of a diagram are in satisfactory agreement with those of Driest. In addition to the solubility of ZnO in aqueous solutions of  $\text{ZnCl}_2$  the author also gives curves showing the solubility of ZnO in aqueous solutions of  $\text{ZnBr}_2$  and of  $\text{ZnI}_2$ .

Cl

Aksel'rud and Spivakovskii (1958) found the salt  $\text{Zn}(\text{OH})_{1.5}\text{Cl}_{0.5} [\text{ZnCl}_2 \cdot 3\text{Zn}(\text{OH})_2]$  to be stable in alkaline solutions containing up to 3.3M  $\text{ZnCl}_2$  and up to 4M NaCl. The activity product is  $4 \times 10^{-14}$ . Upon standing 78 hours this salt is converted to the hydroxide (activity product  $4 \times 10^{-18}$ ).

Data for the solubility of  $\text{ZnCl}_2$  in aq.  $\text{NH}_3$  solutions at 25° are given by Urazov, Kirakosyan and Mkhitarian, 1958.

THE SYSTEM ZINC CHLORIDE - BERYLLIUM CHLORIDE - WATER AT 25°  
(Blidin, 1957)

Sat. Sol. Wt. %		Solid Phase	Sat. Sol. Wt. %		Solid Phase

26.14	33.10	"	0.0	81.20	"

Data for the system ZnCl<sub>2</sub> - KCl - H<sub>2</sub>O at 25° are given by Lipscomb and Hulett, 1915-16.

Data for the extraction of  $\text{ZnCl}_2$  from aqueous  $\text{ZnSO}_4$  solutions by furfural at 25, 50 and 75° are given by Garwin and Winterbottom, 1957.

When 1 gm. of zinc as chloride is dissolved in 100 cc. of aq. 10% HCl and shaken with 100 cc. of ether, 0.03 per cent of the metal enters the ethereal layer. (Mylius, 1911.)

## Zn ZINC

### SOLUBILITY OF ZINC CHLORIDE IN PYRIDINE (Mason and Mathews, 1925)

## Zn ZINC

100 gms. furfural dissolve 85 gms.  $\text{Zn}(\text{ClO}_4)_2 \cdot (?6\text{H}_2\text{O})$  at about  $20^\circ$ .  
 100 gms. cellosolve (mono ethyl ether of ethylene glycol) dissolve 130 gms.  $\text{Zn}(\text{ClO}_4)_2 \cdot (?6\text{H}_2\text{O})$  at about  $20^\circ$ . (Chaney and Mann, 1931.)

## CrO ZINC CHROMATES

100 cc sat. solution of this salt in water contain 10.2 gms.  
 $\text{Zn}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6 (\text{ClO}_4)_2$  at  $20^\circ$ . (Wilke-Dörfurt and Schliephake, 1929.)  
 (See p. 0000 for other zinc antipyrine salts.)

THE SYSTEM  $\text{ZnO} - \text{CrO}_3 - \text{H}_2\text{O}$  AT  $25^\circ$   
 (Woodward, Allen and Anderson, 1956)

Data for the solubility of  $\text{ZnI}_2$  in aqueous  $\text{NH}_3$  solutions at  $25^\circ$  are given by Urazov, Kirakosyan and Mkhitaryan, 1958.

THE SYSTEM ZINC IODIDE - ETHYL ETHER - WATER  
(Guempel, 1929)

Zinc iodide greatly increases the mutual solubility of ether and water. The system has an upper critical solution temperature. At concentrations of salt less than 70 percent a homogeneous liquid is not obtained by increase of temperature.

$t^\circ$ of saturation	Wt. % $\text{ZnI}_2$ in solution	Gms. $(\text{C}_2\text{H}_5)_2\text{O}$ per 100 gms. $(\text{C}_2\text{H}_5)_2\text{O} + \text{H}_2\text{O}$	$t^\circ$ of saturation	Wt. % $\text{ZnI}_2$ in solution	Gms. $(\text{C}_2\text{H}_5)_2\text{O}$ per 100 gms. $(\text{C}_2\text{H}_5)_2\text{O} + \text{H}_2\text{O}$

## O ZINC OXIDE $\text{ZnO}$

Data for the solubility of  $\text{ZnO}$  in fused alkali chlorides and sulfates are given by Voskresenskaya and Kashcheev, 1956.

As part of a study of the system  $\text{ZnO} + \text{Cr}_2\text{O}_3$ , Huttig and Theimer, 1941 determined the solubility of mixtures of  $\text{ZnO}$  and  $\text{Cr}_2\text{O}_3$  in dilute  $\text{HCl}$  and  $\text{H}_2\text{SO}_4$  after heating at various temperatures.

## OH ZINC HYDROXIDE

### SOLUBILITY IN WATER

t°	Solubility				Reference
18	0.00306	gms. $\text{ZnO}$	per liter		(Remy and Kuhlmann, 1924; Remy, 1925)
	0.00292	"	"	"	(Remy and Kuhlmann, 1924; Remy, 1925)
	0.0042	"	"	"	(Dupre)

#### SOLUBILITY OF CRYSTALLINE ZINC HYDROXIDE IN AQUEOUS SOLUTIONS OF AMMONIUM HYDROXIDE AND OF SODIUM HYDROXIDE AT $25^\circ$

(Dietrich and Johnston, 1927)

(Results are also given for  $0^\circ$  and  $35^\circ$ )

Attention is called to the discordant character of previous results due to the uncertain nature of the solid phase present in each case. The authors used crystalline zinc hydroxide prepared by dissolving washed precipitated zinc hydroxide in ammonia and gradually removing the ammonia from the solution by absorption from the vapor phase by concentrated sulfuric acid. The crystals which gradually deposit contain 18.12%  $H_2O$  corresponding to pure  $Zn(OH)_2$ . Equilibrium was reached within 24 hours. The following are the interpolated values from the average experimental results.

# Zn ZINC

## SOLUBILITY OF CRYSTALLINE ZINC HYDROXIDE IN AQUEOUS SOLUTIONS OF AMMONIUM HYDROXIDE AND OF SODIUM HYDROXIDE AT 25°--Cont.

13.7	6.81	28.3	13.8
17.8	9.81	31.75	21.57

Results for the solubility of calcined and hydrated zinc oxide in aqueous solutions of NaOH and of KOH, and for sodium zincate in aqueous solutions of NaOH are given by Muller, Muller and Fouvel, 1927. See also Deshpande and Kabadi, 1951.

THE SYSTEM  $\text{ZnO} - \text{Na}_2\text{O} - \text{H}_2\text{O}$ 

Souchevanov, 1952 constructed the following diagram of the system at  $30^\circ$ . The stable saturating phases are (A)  $\text{NaOH} \cdot \text{H}_2\text{O}$ , (B)  $\text{Na}_2[\text{Zn}(\text{OH})_4]$ , (C)  $\text{Na}[\text{Zn}(\text{OH})_3]$ , (D)  $\text{Na}[\text{Zn}(\text{OH})_3] \cdot 3\text{H}_2\text{O}$ , (E)  $\text{Zn}(\text{OH})_2$ . Metastable solubilities along curve F are in metastable equilibrium with an amorphous hydrate containing 40 mole %  $\text{H}_2\text{O}$ .

Data for the system  $\text{Zn}(\text{OH})_2 - \text{H}_2\text{O}_2 - \text{H}_2\text{O}$  at  $-20$ ,  $-10$ ,  $0$ ,  $20$ ,  $30^\circ$  are reported by Makarov, 1957 and Makarov and Ladeinov, 1957.

Euler states that the higher results of Herz are due to incompletely purified zinc hydroxide and uses material precipitated from the nitrate for his experiments. Different preparations of  $\text{Zn}(\text{OH})_2$  containing from 55 to 77 per cent  $\text{H}_2\text{O}$  were used and in the two cases marked \* ZnO was used.

Bonsdorff used for his second series of determinations,  $\text{Zn}(\text{OH})_2$  precipitated from the nitrate and brought in moist condition into the ammonia solutions.

## Zn ZINC

Zharovskii (1950) gives the  $K_{sp}$  of  $Zn_3(PO_4)_2$  at 18-20° as  $9.1 \times 10^{-33}$ .

Melting points in the system ZnO -  $P_2O_5$  are given by Katnak and Hummel, 1958.

## PO ZINC AMMONIUM PHOSPHATE $ZnNH_4PO_4$

t°	Gms. per liter H <sub>2</sub> O	Reference
10.5	0.0136	(Artmann, 1915)
17.5	0.0145	(Artmann, 1915)
20	0.015	(Vol'fkovich and Remen, 1955)

## ReO ZINC TETRAMINE PERRHENATE $[Zn(NH_3)_4](ReO_4)_2$

One liter sat. solution of this salt in aqueous ammonia of d = 0.930 (19 percent) contain 1.852 gm. at 20°. (Wilke-Dorfurt and Gunzert, 1933.)

## S ZINC SULFIDE ZnS

The solubility product was calculated from thermochemical data by Kapustinsky, 1940 who found the value  $7.4 \times 10^{-27}$ . The calculated solubility in moles per liter is as follows:

pH =	3	5	7	9	11
S =	$8.3 \times 10^{-6}$	$8.3 \times 10^{-8}$	$1.2 \times 10^{-9}$	$8.6 \times 10^{-11}$	$8.6 \times 10^{-12}$

Critical reviews of the published determinations of the solubilities of the metal sulfides in water are given by Kolthoff, 1931, and Ravitz, 1936. The preferred value for ZnS, calculated by Ravitz with the aid of recent viscosity data is  $1.47 \times 10^{-9}$  gm. mols. per liter.

1000 cc. aq. 2.0 n  $H_2SO_4$  sat. with  $H_2S$  at 1 atmosphere pressure, dissolve 0.6172 gm. ZnS (=  $6.34 \cdot 10^{-3}$  gm. mols. ZnS) at 20°. (Moser and Behr, 1924.)

Goates, Gordon and Faux (1952) calculated the thermodynamic  $K_{sp}$  at 25° to be  $8 \times 10^{-25}$ .

At 200°, 0.00005 gms. ZnS dissolve in 100 gms.  $H_2O$ ; at 300°, 0.0001 gms. dissolve. (Verhoogen, 1937.)

ZINC SULFITE  $\text{ZnSO}_3$ 

50

EQUILIBRIUM IN THE SYSTEM ZINC OXIDE, SULFUR DIOXIDE AND WATER  
(Terres and Buhl, 1934)

The determinations were made by the synthetic method. The results are given in the present paper only in the form of a small diagram from which the following approximate values were read. Additional data are given at 20° by Jager, 1957.

Results at 15°			Results at 25°		
Mol. Percent in sat. sol.		Solid Phase	Mol. Percent in sat. sol.		Solid Phase

7, 6, 4, 2, 1 refer to NiSO<sub>4</sub>·7H<sub>2</sub>O, ·6H<sub>2</sub>O, ·4H<sub>2</sub>O, ·2H<sub>2</sub>O and ·H<sub>2</sub>O.

Other determinations in satisfactory agreement with the above are given by Caven and Johnston, 1926, 1928 and Benrath, 1931.

Data for the solubility of ZnSO<sub>4</sub> in water at high pressures are given by Cohen and Sinnige, 1909, 1910.

Additional data on the hydrate transitions is given by D'Ans, Freund and Kaufman, 1957.

## Zn ZINC

Additional data in the system  $\text{ZnSO}_4 - \text{ZnO} - \text{H}_2\text{O}$  are given by Aksel'rud and Fialkov, 1950.

Gromov gives results in the system  $\text{ZnSO}_4 - \text{ZnO} - \text{FeSO}_4 - \text{H}_2\text{O}$  at  $18^\circ$ .

The solubility product of  $\text{ZnSO}_4 \cdot 3\text{Zn}(\text{OH})_2$ , determined from potentiometric titration curves is  $10^{-52}$ . (Nikurashin, 1938.)

### THE SYSTEM ZINC SULFATE - AMMONIA - WATER AT $0^\circ$ (Applebey and Windridge, 1932)

30	d. of sat. sol.	Gms. per 100 gms. sat. sol.		Solid Phase	d. of sat. sol.	Gms. per 100 gms. sat. sol.		Solid Phase
		NH <sub>3</sub>	ZnSO <sub>4</sub>			NH <sub>3</sub>	ZnSO <sub>4</sub>	
	1.435	17.75	42.20	1.4.2	0.956	23.56	4.37	1.4.2

-	-	-	0.895	30.03	1.23	"
-	-	-	0.887	32.43	0.43	solid sol.
-	-	-	0.880	33.30	0.49	"
-	-	-	-	38.75	0.01	"

Several results similar to the above are given for other temperatures.

ZINC POTASSIUM SULFATE  $\text{ZnK}_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ 

30

100 gms. of a saturated solution in water at 25° contain 11.72 gms.  $\text{ZnK}_2(\text{SO}_4)_2$  (0.3873 moles per liter), and the density is 1.109. (Hill, Burham, and Ricci, 1940)

Additional data in the system  $\text{ZnSO}_4 - \text{K}_2\text{SO}_4 - \text{H}_2\text{O}$  at 25° are reported by Lipscomb and Hulett (1915-16).

ZINC AMMONIUM SULFATE  $\text{Zn}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ 

30

100 gms. of a saturated solution in water at 25° contain 12.24 gms.  $\text{Zn}(\text{NH}_4)_2(\text{SO}_4)_2$  (0.4601 moles per liter), and the density is 1.103. (Hill and Taylor, 1938)

SOLUBILITY OF ZINC SULFATE IN AQUEOUS ETHYL ALCOHOL  
(Schiff, 1861)

Concentration of Alcohol	10%	20%	40%
Gms. $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ per 100 Gms. Solution	51.1	39	3.45

SOLUBILITY OF ANHYDROUS ZINC SULFATE IN:  
(Gibson, Driscoll and Jones, 1929)

Methyl Alcohol			Ethyl Alcohol		
t°	Gms. $\text{ZnSO}_4$ per 100 gms. $\text{CH}_3\text{OH}$	Solid Phase	t°	Gms. $\text{ZnSO}_4$ per 100 gms. $\text{CH}_3\text{OH}$	Solid Phase

35	0.408	"	35	0.029	"
45	0.420	"	55	0.020	"
55	0.463	$\text{ZnSO}_4 \cdot \text{CH}_3\text{OH} (?)$			

100 ml of solution in methyl alcohol, saturated with  $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$  at 5°, contain 1.1 gms.  $\text{ZnSO}_4$  (Barber and Ali, 1950)

100 gms. abs. methyl alcohol dissolve 0.65 gm.  $\text{ZnSO}_4$  at 18°, 5.90 gms.  $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$  at 18°.

100 gms. 50 per cent methyl alcohol dissolve 15.7 gms.  $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$  at 18°. (deBruyn, 1891.)

100 gms. glycerol dissolve 35 gms. zinc sulfate at 15.5°. (Ossendowski, 1907.)

THE SYSTEM ZINC SULFATE - ACETONE - WATER AT 25°  
(Leaming, 1925)

The binodal curve for this system was determined by the titration method; tie lines or the plait point were not determined. The author's results were plotted and the following values taken from the average curve.

	Gms. per 100 gms. homogeneous liquid			Gms. per 100 gms. homogeneous liquid		
	ZnSO <sub>4</sub>	(CH <sub>3</sub> ) <sub>2</sub> CO	H <sub>2</sub> O	ZnSO <sub>4</sub>	(CH <sub>3</sub> ) <sub>2</sub> CO	H <sub>2</sub> O
50	30.0	4.0	66.0	11.7	17.5	70.8
	27.0	5.0	68.0	9.3	20.0	70.7
	25.0	6.0	69.0	7.5	22.5	70.0
	22.2	7.5	70.3	5.7	25.0	69.3
	19.0	10.0	71.0	4.2	27.5	68.3
	16.4	12.5	71.1	3.0	30.0	67.0
	14.0	15.0	71.0	2.2	32.5	65.1

The composition of the homogeneous mixture mixture (plait point) of the system zinc sulfate + tertiary butyl alcohol + water at 25° was found by Ginnings, Hering and Webb, 1933, to be

6.0 gms. ZnSO<sub>4</sub> + 25.5 gms. (CH<sub>3</sub>)<sub>3</sub>COH + 68.5 gms. H<sub>2</sub>O

The original results for the remaining points on the binodal curve are not given but only the values of a series of constants, calculated by means of empirical equations.

THE SYSTEM ZINC SULFATE - URETHAN - WATER AT 25°  
(Palitzsch, 1928, 1929)

Gms. Mols. per 1000 gms. H <sub>2</sub> O		Solid Phase
ZnSO <sub>4</sub>	NH <sub>2</sub> COOC <sub>2</sub> H <sub>5</sub>	
3.59	0.0	ZnSO <sub>4</sub> ·?H <sub>2</sub> O
0.02	49.84	Upper liquid layer
3.51	0.239	Lower liquid layer
0.0	53.09	NH <sub>2</sub> COOC <sub>2</sub> H <sub>5</sub>

Data for the system ZnSO<sub>4</sub> - urea - H<sub>2</sub>O from -20° to +25° are given by Bergman and Sulaimankulov, 1957.

Melting points in the system ZnSO<sub>4</sub> - CsBr are given by Luzhnaya and Vereshchetina, 1956.

50 ZINC SULFAMATE Zn(SO<sub>3</sub>NH<sub>2</sub>)<sub>2</sub>

Cupery (1938) found the solubility to be 115 gms. per 100 gms. of water at 25°.

ZINC SELENITE  $\text{ZnSeO}_3$ 

SeO

The  $K_{sp} [\text{Zn}^{++}] [\text{SeO}_3^{=}]$  is  $2.58 \times 10^{-7}$ . (Chukhlantsev, 1916.)

ZINC SELENATE  $\text{ZnSeO}_4$ 

SeO

SOLUBILITY OF ZINC SELENATE IN WATER  
(Klein, 1940)

t°	Density	Gms. $\text{ZnSeO}_4$ per 100 gms.		Solid Phase

1.5525	3.663	180.2	-	13.17	2.11

### CH ZIRCONIUM CUPFERRATE

Data for the solubility in acidic solutions is given by  
Fujiwara, 1951.

### ZIRCONIUM THENOYL TRIFLUORO ACETONATE

SOLUBILITY IN BENZENE  
(Huffman and Iddings, 1949)

t°	Gms. $\text{ZrTTA}$ per liter
20	17.2
30	25.4
40	38.0

Data for the solubility in the presence of excess thenoyl tri-  
fluoroacetone and in contact with  $\text{HClO}_4$  solutions and  $\text{H}_2\text{O}$  are also  
given.

### SCN ZIRCONIUM THIOCYANATE $\text{Zr}(\text{SCN})_4$

DISTRIBUTION OF ZIRCONIUM THIOCYANATE BETWEEN WATER AND ETHER  
(Fischer and Chalybaeus, 1947)

A 0.5 N solution of  $\text{HSCN}$  containing  $\text{Zr}(\text{CNS})_4$  in ether was shaken  
with aqueous solutions of ammonium salts at room temperature. All data  
are in gms. per liter.

## DISTRIBUTION OF ZIRCONIUM THIOCYANATE BETWEEN WATER AND ETHER--Cont.

SCN

ZIRCONIUM TETRACHLORIDE ZrCl<sub>4</sub>

Cl

Data for the extraction of Zr from HCl solutions by tributyl phosphate are reported by Levitt and Freund, 1956.

SOLUBILITY OF ZIRCONIUM TETRA CHLORIDE IN LIQUID SULFUR DIOXIDE  
(Bond and Stephens, 1929)

A monel metal bomb having two chambers communicating by means of a needle valve, was used.

t°	Gm. mol. ZrCl <sub>4</sub> per 1.0 mol. ZrCl <sub>2</sub> + SO <sub>2</sub>
0	0.0138
10	0.0199
20	0.0258

Data for the system ZrCl<sub>4</sub> + POCl<sub>3</sub> are given by Sheka and Voitovich, 1956. Melting points in the system ZrCl<sub>4</sub> + NaCl are given by Morozov and Korshunov, 1956. Other results for ZrCl<sub>4</sub> + NaCl, ZrCl<sub>4</sub> + KCl and for ZrCl<sub>4</sub> + NaCl + KCl are given by Howell, Sommer and Kellogg, 1957.

ZIRCONIUM OXYCHLORIDE ZrOCl<sub>2</sub>·8H<sub>2</sub>OSOLUBILITY OF ZIRCONIUM OXYCHLORIDE IN AQUEOUS HYDROCHLORIC ACID AT 20°  
(v. Hevesy, 1923)

Constant agitation for many hours was employed. The zirconium oxychloride contained 0.4% oxide of hafnium. The solid phase was ZrOCl<sub>2</sub>·8H<sub>2</sub>O up to concentrations of 10 normal HCl.

## Zr ZIRCONIUM

Normality of Aq. HCl	Gms. ZrO <sub>2</sub> per liter sat. sol.	Mols. ZrOClO <sub>2</sub> per liter sat. sol.	Normality of Aq. HCl	Gms. ZrO <sub>2</sub> per liter sat. sol.	Mols. ZrOClO <sub>2</sub> per liter sat. sol.

Results for the addition of concentrated sulfuric and nitric acids to this salt may be found under  $Zr(SO_4)_2$  and  $Zr(NO_3)_4$ , respectively.

C1

Data for the extraction of Zr from  $ClO_4^-$  solutions by various combinations of fluorinated  $\beta$ -diketones are given by Huffman, Iddings and Osborne, 1955.

## F ZIRCONIUM FLUORIDE $ZrF_4$

THE SYSTEM  $ZrF_4 - HF - H_2O$  at  $0.5^\circ$   
(Tananaev, Nikolaev and Buslaev, 1956)

Sat. Sol. Wt. %		Solid Phase	Sat. Sol. Wt. %		Solid Phase
HF	ZrO <sub>2</sub>		HF	ZrO <sub>2</sub>	
2.21	3.14	$ZrOF_2 \cdot 2H_2O$	31.63	0.015	$H_2ZrF_6 \cdot H_2O$
3.95	6.19		84.35	31.95	
5.84	7.92	$ZrF_4 \cdot 3H_2O$	85.81	0.0107	$ZrF_4$
30.00	32.37		99.98	0.015	

Data for the extraction of Zr from aqueous HF solutions (1 - 20M) at  $20^\circ$  by diethyl ether are given by Bock and Harrmann, 1956.

The mole fraction of  $ZrF_4$  in a saturated solution in water at  $25^\circ$  is 0.0016. In hydrogen fluoride at  $12^\circ$  it is 0.00001. (Shept, Hyman and Katz, 1953.)

Data for the solubility of  $ZrF_4$  in 1 - 16 N  $HNO_3$  from  $0 - 80^\circ$  are given by Chapman and Slansky, 1958.

## ZIRCONIUM POTASSIUM HEXA FLUORIDE $ZrK_2F_6$

### SOLUBILITY OF ZIRCONIUM POTASSIUM HEXA FLUORIDE IN AQUEOUS SOLUTIONS OF HYDROFLUORIC ACID AT $20^\circ$

(v. Hevesy, 1925; v. Hevesy, Christiansen and Berglund, 1925)

Normality of aq. HF	0.125	5.89
Mols. $ZrK_2F_6$ per liter	0.0655	0.1298

ZIRCONIUM AMMONIUM FLUORIDES  $\text{Zr}(\text{NH}_4)_2\text{F}_6$  and  $\text{Zr}(\text{NH}_4)_3\text{F}_7$ 

F

## SOLUBILITY OF EACH SEPARATELY IN WATER

(v. Hevesy, 1925; v. Hevesy, Christiansen and Berglund, 1925)

The solutions were saturated by constant shaking in a thermostat.

Compound	t°	d. of sat. sol.	Mol. per liter sat. sol.

SOLUBILITY OF ZIRCONIUM AMMONIUM HEPTA FLUORIDE IN AQUEOUS SOLUTIONS  
OF AMMONIUM FLUORIDE AT 20°

(v. Hevesy, 1925; v. Hevesy, Christiansen and Berglund, 1925)

The mixtures were constantly agitated in a flask of ebonite.

## F ZIRCONIUM OXYFLUORIDE $ZrOF_2 \cdot 2HF \cdot 2H_2O$

SOLUBILITY OF ZIRCONIUM OXYFLUORIDE IN AQUEOUS SOLUTIONS OF  
HYDROFLUORIC ACID AT 25°  
(v. Hevesy and Wagner, 1930)

d. of sat. sol.	Normality of Aq. HF	Gms. $ZrO_2$ per liter sat. sol.	d. of sat. sol.	Normality of Aq. HF	Gms. $ZrOx$ per liter sat. sol.
1.489	0	408.5	1.685	10.05	548.5
1.559	1.06	502.2	1.600	15.05	444.3
1.712	6.03	571.8	1.430	20.09	288.3

The salt  $ZrF_4 \cdot 3H_2O$  crystallizes from aqueous hydrofluoric acids of concentrations between 5.0 and 20.0 normal.

## NO ZIRCONIUM NITRATE $Zr(NO_3)_4$

SOLUBILITY OF ZIRCONIUM NITRATE IN  
NITRIC ACID SOLUTIONS AT ROOM TEMPERATURE  
(Falinski, 1941)

The data were obtained by the addition of  $HNO_3$  to  $ZrOCl_2 \cdot 8H_2O$  in varying proportions. The mixtures were stirred at room temperature and atmospheric pressure and both solution and solid were analyzed.

Method of Preparation	Gms. per 100 gms. Sat. Sol.		Solid Phase
	$HNO_3$	$ZrO_2$	
10 g $ZrOCl_2 \cdot 8H_2O$ + 15.5 cc fuming $HNO_3$	59.4	14.8	$Zr(NO_3)_4 \cdot 6H_2O$
20 g $ZrOCl_2 \cdot 8H_2O$ + 50 cc fuming $HNO_3$	59.5	14.6	"
10 g $ZrOCl_2 \cdot 8H_2O$ + 20 cc fuming $HNO_3$	60.9	13.2	"

" "	83.3	8.06	"
" "	84.8	8.58	"
" "	86.9	9.23	$Zr(NO_3)_4 \cdot 2HNO_3 \cdot 3H_2O$ (?)

100 cc of a saturated solution of zirconium nitrate in ethyl ether, prepared by frequent agitation and allowing to stand over night at about 20°, contain 0.003 gm.  $ZrO_2$ . A saturated ethereal solution prepared as above, but using zirconium titrate which had been dehydrated at 150°, contain 0.004 gm.  $ZrO_2$  per 100 cc. (Wells, 1930.)

Data for the extraction of Zr(IV) from  $HNO_3 + Ca(NO_3)_2$  solutions at 20° by methyl isobutyl ketone is given by Rydberg and Bernstrom, 1957.

### ZIRCONIUM OXYNITRATE $ZrO(NO_3)_2 \cdot 2H_2O$

NO

0.37 gms.  $ZrO(NO_3)_2$  are dissolved in 100 gms. of a saturated solution in isoamyl alcohol at room temperature. Less than 0.1 gms. dissolve in methyl n-hexyl ketone under the same conditions. (Rothschild, Templeton and Hall, 1948).

### ZIRCONIUM HYDROXIDE $Zr(OH)_4$

OH

- The Ksp of  $Zr(OH)_4$  is  $8 \times 10^{-52}$ . (Korenman, 1955)

- Assuming the reaction,  $Zr(OH)_4 \rightleftharpoons Zr(OH)_2^{++} + 2OH^-$ , the Ksp is  $3 \times 10^{-26}$ . (Larsen and Gammill, 1950)

Oka, 1940 found the solubility to be  $8.0 \times 10^{-11}$  moles per liter by potentiometric titration.

Melting points in the system  $ZrO_2 - CaCl_2$  are given by Belozersky and Kucherenko, 1940.

Data for the solubility of  $ZrO_2$  in molten cryolite is given by Kido, 1954.

### ZIRCONIUM PHOSPHATE $ZrO(H_2PO_4)_2$

PO

#### SOLUBILITY OF ZIRCONIUM PHOSPHATE IN AQUEOUS HYDROCHLORIC ACID AT 20° (v. Hevesy and Kimura, 1925)

About 0.1 gm. of the compound was shaken with about 150 cc. of the hydrochloric acid in a thermostat for 3 days. 100 cc. of the sat. solution were evaporated and the residue ignited.

Normality of aq. HCl	Gms. ignited residue from 100 cc. sat. sol.	Mol. $ZrO(H_2PO_4)_2$ per liter sat. sol.

# Zr ZIRCONIUM

## SO ZIRCONIUM SULFATE $Zr(SO_4)_2$

### SOLUBILITY OF ZIRCONIUM SULFATE IN SULFURIC ACID SOLUTIONS (Falinski, 1941)

Varying amounts of sulfuric acid were added to  $Zr(SO_4)_2 \cdot 4H_2O$  and up to two years were required to reach equilibrium, during which time the %  $ZrO_2$  in solution fell continuously. The solid phases are similar to those found by Hauser (following), but the compositions of the saturated solutions differ somewhat. Additional data was obtained by adding sulfuric acid and oleum to  $ZrOCl_2 \cdot 8H_2O$ , in which cases the solid was changed to a sulfate. Additional data are given by D'Ans and Eick (see below).

G = a higher basic sulfate

SOLUBILITY OF ZIRCONIUM SULFATE IN WATER AND ZIRCONIUM OXIDE SOLUTIONS  
(Falinski, 1941)

When zirconium sulfate is dissolved in water, the saturated solution contains 44.0 wt. %  $\text{Zr}(\text{SO}_4)_2$  at 25° and 45.0% at 40°. The stable phase is  $\text{Zr}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$ . When much water is added to the salt, such that the solution contains less than about 19%  $\text{Zr}(\text{SO}_4)_2$ , the basic salt  $\text{ZrO}_2 \cdot 5\text{SO}_3 \cdot 30\text{H}_2\text{O}$  precipitates. The system was studied by varying the amounts of water added, and by a large number of dialysis experiments in which the products were separated, analyzed, etc. Prolonged boiling of moderately concentrated  $\text{Zr}(\text{SO}_4)_2$  solutions precipitates  $2\text{ZrO}_2 \cdot 3\text{SO}_3 \cdot 5\text{H}_2\text{O}$ , and when there is a very large amount of water present, there is an indication of the formation of  $2\text{ZrO}_2 \cdot \text{SO}_3 \cdot 7\text{H}_2\text{O}$ . The results below are in grams per 100 gms. of saturated solution and the saturating phase is  $7\text{ZrO}_2 \cdot 5\text{SO}_3 \cdot 30\text{H}_2\text{O}$ .

ZIRCONIUM THALLIUM SULFATE

SOLUBILITY OF ZIRCONIUM THALLIUM SULFATE IN AQUEOUS 20% SULFURIC ACID  
(Fernandez, 1925)

A solution of zirconium sulfate in aqueous sulfuric acid of about 20 per cent concentration was saturated with thallium sulfate at 100° and this solution cooled to several constant temperatures and the weight of  $\text{ZrO}_2$  present at each temperature determined. The following three double salts are described,  $\text{Zr}(\text{SO}_4)_2 \cdot 2\text{Tl}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$ ;  $2\text{Zr}(\text{SO}_4)_2 \cdot \text{Tl}_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$  and  $2\text{Zr}(\text{SO}_4)_2 \cdot 7\text{Tl}_2\text{SO}_4$ . The particulier one in contact with each saturated solution is not designated.
